Important Safety and Usage Information

Intended Use and Limitations: This software, developed by Invantive, is designed to support a variety of business and information technology data processing functions, such as accounting, financial reporting an sales reporting. It is important to note that this software is not designed, tested, or approved for use in environments where malfunction or failure could lead to life-threatening situations or severe physical or environmental damage. This includes, but is not limited to:

- Nuclear facilities: The software should not be used for operations or functions related to the control, maintenance, or operation of nuclear facilities.
- Defense and Military Applications: This software is not suitable for use in defense-related applications, including but not limited to weaponry control, military strategy planning, or any other aspects of national defense.
- Aviation: The software is not intended for use in the operation, navigation, or communication systems of any aircraft or air traffic control environments.
- Healthcare and Medicine Production: This software should not be utilized for medical device operation, patient data analysis for critical health decisions, pharmaceutical production, or medical research where its failure or malfunction could impact patient health.
- Chemical and Hazardous Material Handling: This software is not intended for the management, control, or operational aspects of chemical plants or hazardous material handling facilities. Any malfunction in software used in these settings could result in dangerous chemical spills, explosions, or environmental disasters.
- Transportation and Traffic Control Systems: The software should not be used for the control, operation, or management of transportation systems, including railway signal controls, subway systems, or traffic light management. Malfunctions in such critical systems could lead to severe accidents and endanger public safety.
- Energy Grid and Utility Control Systems: This software is not designed for the control or operation of energy grid systems, including electrical substations, renewable energy control systems, or water utility control systems. The failure of software in these areas could lead to significant power outages, water supply disruptions, or other public utility failures, potentially endangering communities and causing extensive damage.
- Other High-Risk Environments: Any other critical infrastructure and environments where a failure of the software could result in significant harm to individuals or the environment.

User Responsibility: Users must ensure that they understand the intended use of the software and refrain from deploying it in any setting that falls outside of its designed purpose. It is the responsibility of the user to assess the suitability of the software for their intended application, especially in any scenarios that might pose a risk to life, health, or the environment.
Disclaimer of Liability: Invantive disclaims any responsibility for damage, injury, or legal consequences resulting from the use or misuse of this software in prohibited or unintended applications.

1 SQL Driver for Visma.net Financials API

Invantive UniversalSQL is the fastest, easiest and most reliable way to exchange data with the Visma.net Financials API.

Use the "Search" option in the left menu to search for a specific term such as the table or column description. When you already know the term, please use the "Index" option. When you can't find the information needed, please click on the Chat button at the bottom or place your question in the user community. Invantive Support or other users will try to help you.

Visma.net Financials is online software for accounting. Visma.net is used both by large accounting firms as well as large entrepreneurs.

The Visma.net Financials driver covers 783 tables and 60336 columns.

Visma.net Financials API Clients

Invantive UniversalSQL is available on many user interfaces ("clients" in traditional server-client paradigma). All Invantive UniversalSQL statements can be exchanged with a close to 100% compatibility across all clients and operating systems (Windows, MacOS, Linux, iOS, Android).

The clients include Microsoft Excel, Microsoft Power BI, Microsoft Power Query, Microsoft Word and Microsoft Outlook. Web-based clients include Invantive Cloud, Invantive Bridge Online as OData proxy, Invantive App Online for interactive apps, Online SQL Editor for query execution and Invantive Data Access Point as extended proxy.

The Visma.net Financials Power BI connector is based on the Invantive UniversalSQL driver for Visma.net Financials, completed by a high-performance OData connector which works straight on Power BI without any add-on. The OData protocol is always version 4, independent whether the backing platform uses OData, SOAP or another protocol.

For technical users there are command-line editions of Invantive Data Hub running on iOS, Android, Windows, MacOS and Linux. Invantive Data Hub is also often used for enterprise server applications such as ETL. High-volume replication of data taken from the Visma.net Financials API into traditional databases such as SQL Server (on-premises and Azure), MySQL, PostgreSQL and Oracle is possible using Invantive Data Replicator. Invantive Data Replicator automatically creates and maintains Visma.net Financials datawarehouses, possibly in combination with data from over 75 other (cloud) platforms. Invantive Data Replicator supports data volumes up to over 1 TB and over 5.000 companies. The on-premise edition of Invantive Bridge offers an Visma.net Financials ADO.net provider.

Finally, online web apps can be build for Visma.net Financials using App Online of Invantive Cloud.

Monitor API Calls

When a query or DML-statement has been executed on Invantive UniversalSQL a developer can evaluate the actual calls made to the Visma.net Financials API using a query on sessionios@DataDictionary. As an alternative, extensive request and response logging can be enabled by setting log-native-calls-to-disk to true. In the %USERPROFILE% \Invantive\NativeLog folder Invantive UniversalSQL will create log files per Visma.net Financials API request and response.

Specifications

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The SQL driver for Visma.net Financials supports partitioning: data from multiple companies are all listed together in one table. The value of the column COMPANY_CODE indicates which company the data belongs to.

An introduction into the concepts of Invantive UniversalSQL such as databases, data containers and partitioning can be found in the Invantive UniversalSQL grammar.

The configuration can be changed using various attributes from the database definition, on log on and during use. A full list of configuration options is listed in the driver attributes 2.

The catalog name is used to compose the full qualified name of an object like a table or view. The schema name is used to compose the full qualified name of an object like a table or view. On Visma.net Financials the comparison of two texts is case sensitive by default.

Changes and bug fixes on the Visma.net Financials SQL driver can be found in the release notes. Get access to the community through the Visma.net Financials section of the Invantive forums.

Driver code for use in settings.xml: `VismaNet`

Alias: `vnet`

Recommended alias: `vnt`

Partition Label: `Company`

More technical documentation as provided by the supplier of Visma.net Financials on the native connection used can be found at https://integration.visma.net/API-index/#/.

Technical support (URL): https://visma-software-nl.force.com/supportportal/s/

Technical support discord community: https://discord.gg/3qupMPPr4K

Please make sure your user is authorized to use the API when no companies are listed in AvailableContext. Typically the user needs the following user roles: 'Financials User' and 'Financials Administrator'. Test the privileges using https://integration.visma.net/API-index/ and choosing the 'Authorize' button. When successfully authorized, the Authorize button should be replaced by a 'Logout' button. In case of a JSON error message contact your application administrator.

2 {res:itgen_doc_sql_attr_api}

The SQL driver for Visma.net Financials has many attributes that can be finetuned to improve handling in scenarios with unreliable network connections to the API server of Visma.net Financials or high volumes of data. Also, many drivers have driver-specific attributes to finetune actual behaviour or handle data not matching specifications.

The Visma.net Financials driver attributes are assigned a default value which seldom requires change. However, changes can be applied when needed on four levels, which are reflected in the table below by separate checkmarks:

- Connection string: the connection string from the settings*.xml file and applied during log on.
- Set SQL statement: a set SQL-statement to be executed once connection has been established.
- Log on: value to be specified interactively by user during log on in a user interface.

The connection string for Visma.net Financials can be found in the settings*.xml file used for the database. The reference manuals contain instructions how to relocate the settings*.xml

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

files. Settings*.xml files are typically located in the `%USERPROFILE%\invantive` folder in most deployment scenarios. Each data container of a database in the connection string can have a `connectionString` element specifying the name and values of attributes. Both name and value must be properly escaped according to XML-semantics. Actual application of the value is solely done during log on. A new connection must be established to change the value of a driver attribute using a connection string.

The set SQL statement can be executed after log on. The syntax is: `set NAME VALUE`, or for a distributed database: `set NAME@ALIAS VALUE`. In some scenarios you may need to enclose the driver attribute name in square brackets to escape it from parsing, for instance when a reserved SQL keyword is part of the name. The new value takes effect straight after execution of the set-statement. The set-statement can be executed as often as needed during a session.

Driver attributes that can be interactively set to a value are typically presented in the log on window. Depending on the platform and design decisions of the user interface designer, some or all of the available driver attributes can have been made available.

The Visma.net Financials driver can be configured using the following attributes:

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
add-odata-mandatory-filters	Whether to automatically add OData filters deemed necessary by the platform.	OData	False	✓	✓	✓	
analysis-enforce-row-uniqueness	Enforce rows to be unique for software analysis. A fingerprint is calculated from the whole row of data when the primary key column is unknown.	Shared	False	✓	✓	✓	
api-access-token	Access Token is a security token for multiple OAuth2 Flows. With an Access Token you can access protected resources. An Access Token must be stored securely since once compromised allows access to your protected resources.	OData		✓	✓	✓	✓
api-client-id	The client ID is a unique identifier of your application. It is generated by registering an application.	OData		✓		✓	✓
api-client-secret	The client secret is to be kept confidential. Such as a password for a logon code, the client secret is the confidential part of an app identified by a client ID. It is needed during the OAuth2 Code Grant Flow together with the refresh token to get access.	OData		✓		✓	✓
api-pre-expiry-refresh-sec	The number of seconds before the token expires to acquire a new token.	OData		✓	✓	✓	
api-redirect-url	The redirect URI is the website a browser session is redirected to after the OAuth2 authentication process has been completed.	OData		✓		✓	✓

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
invantive-sql-shuffle-fetch-results-data-containers	Whether to shuffle results fetched from data containers.	SQL Engine V1	False	✓	✓	✓	
invantive-use-cache	Whether to cache the results of a query.	SQL Engine V1	True	✓	✓	✓	
join-set-points-per-request	Maximum number of values in a request when executing a join set.	OData	60	✓	✓	✓	
limit-partition-calls-left	Minimum number of remaining API calls on a partition towards a hard limit. When below, an error is raised.	OData	500	✓	✓	✓	
log-native-calls-to-disk-max-events	Maximum number of call events to register from last activation.	Shared		✓	✓	✓	
log-native-calls-to-disk-max-seconds	Maximum number of seconds to register calls from last activation.	Shared		✓	✓	✓	
log-native-calls-to-disk-on-error	Registers native calls to data container backend as disk files when the call raised an error.	Shared	False	✓	✓	✓	
log-native-calls-to-disk-on-success	Registers native calls to data container backend as disk files when the call raised no error.	Shared	False	✓	✓	✓	
log-native-calls-to-trace	Log native calls to data container backend on the trace.	Shared	False	✓	✓	✓	
maximum-discovered-column-count	Maximum number of discovered columns. An error will be generated when the column exceeds this value.		250	✓	✓	✓	✓
maximum-length-identifiers	Non-default maximum length in characters of identifier names.	Shared		✓	✓	✓	
max-odata-filters	Maximum number of OData filter elements.	OData	100	✓	✓	✓	
max-odata-rewrite-in-count	{res:itgen_pae_max_odata_rewrite_in_count}	OData	500	✓	✓	✓	
max-url-length-accepted	The maximum accepted URL length before raising an error.		8000	✓	✓	✓	
max-url-length-desired	The maximum desired URL length.		8000	✓	✓	✓	
metadata-cache-max-age-sec	Maximum acceptable age in seconds for re-use of metadata.	OData		✓	✓	✓	
oauth-unauthorized-max-tries	Maximum number of tries when an OAuth exception occurs.		2	✓	✓	✓	
oauth-unauthorized-sleep-initial-ms	Initial sleep in milliseconds between OAuth reauthentication tries when the OAuth authentication fails.		10000	✓	✓	✓	
oauth-unauthorized-sleep-max-ms	Maximum sleep in milliseconds between OAuth reauthentication tries when the OAuth authentication fails.		1000	✓	✓	✓	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Code	Description	Origin	Default Value	Set from Connection String	Set from Set SQL-Statement	Set from Drivers File	Set from Log On
oauth-unauthorized-sleep-multiplicator	Multiplication factor for sleep between OAuth reauthentication tries when the OAuth authentication fails.		2	✓	✓	✓	
page-size-rows	Number of rows to retrieve per page.	Visma.net Financials	100	✓	✓	✓	
partition-slot-based-rate-limit-length-ms	Total length in milliseconds across all slots of a partition-based rate limit.	Shared	60000	✓		✓	
partition-slot-based-rate-limit-slots	Number of slots per partition-based rate limit. Null means no slot-based rate limit.	Shared		✓		✓	
pre-request-delay-ms	Pre-request delay in milliseconds per request.	Shared	0	✓	✓	✓	
requested-maximum-usable-partitions	Requested Maximum Usable Partitions	Shared		✓	✓	✓	
requested-page-size	Preferred number of rows to exchange per round trip; only effective on limited platforms such as AFAS Online.	Shared		✓	✓	✓	
requests-parallel-max	Maximum number of parallel data requests from individual partitions on the data container.	Shared	32	✓	✓	✓	
simulate-http-400-errors	Simulate HTTP 400 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓	
simulate-http-400-errors-percentage	Percentage of simulated HTTP 400 errors when exchanging results with the HTTP endpoint.		0	✓	✓	✓	
simulate-http-401-errors	Simulate HTTP 401 errors when exchanging results with the HTTP endpoint.		False	✓	✓	✓

AccountByCode: Visma.net Financials General Ledger Account by Code

Get a specific Account - ScreenId=GL202500Data for AccountThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Account

Label: General Ledger Account by Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function AccountByCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
accountCd		☑		Return the Information from Chart of account for the specified AccountCD

Columns of Table Function

The columns of the table function AccountByCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accountCD	varchar2	Account Code	☐	Mandatory field: The table > Account* > The unique identifier of the general ledger account in the system.
accountClass	varchar2	Account Class	☐	The table > Account class > Optional. The account class to w hich the account is assigned.
accountClassDescription	varchar2		☐	The table > Desc > An alphanumeric string of up to 30 characters that describes the AccountClass.
accountGroupCD	varchar2	Account Group Code	☐	The table > Account group > The account group (used in project management if the Projects module has been activated) that includes this account.
accountID	int32	Account ID	☐	The table > AccountID > The Account ID is the actual ID that the account have in the database and are used in other tables as the relation betw een the Chart of accounts table and other tables.
active	char	Active	☐	The table > Active > A check box that indicates that the account is active.
allow ManualEntry	char		☐	
analisysCodeInfo_description	varchar2		☐	Name of item/description
analisysCodeInfo_number	varchar2		☐	Number of item
cashAccount	char	Cash Account	☐	The table > Cash account > A check box that indicates (if selected) that the account has a cash account or multiple cash accounts linked to it.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlAccountModule	varchar2		☐	
currency	varchar2	Currency	☐	The table > Currency > Optional: This column appears only if support for multiple currencies has been activated for the system.
description	varchar2	Description	☐	The table > Description > An alphanumeric string of up to 30 characters that describes the account.
errorInfo	varchar2	Error Message	☐	
externalCode1Info_description	varchar2		☐	Name of item/description

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
externalCode1Info_number	varchar2		☐	Number of item
externalCode2Info_description	varchar2		☐	Name of item/description
externalCode2Info_number	varchar2		☐	Number of item
lastModifiedDateTime	datetime	Last Modified	☐	This information is not visible in the w indow . It is collected from the system.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
postOption	varchar2	Post Option	☐	The table > Post option > An option that defines how transactions created in other w orkspaces are posted to this account. Summary (default) or Detail.
publicCode1	varchar2	Public Code 1	☐	The table > Public code 1 > The authorities valid code mapped to the account. Used for example in SAF-T and in some nationals reporting to the authorities.
taxCategory	varchar2	Tax Category	☐	The table > VAT category > A tax category that you define for the selected account. When you create a journal transaction manually in the GL301000 w indow , based on this VAT category, the taxable amount w ill be calculated for the journal entry.
timeStamp	blob	Timestamp	☐	
type	varchar2	Type	☐	The table > Type > The type of account: Asset, Liability, Income, or Expense.
useDefaultSub	char		☐	The table > Use default sub > A check box that causes the system (if selected) to set the default subaccount as the Subaccount if the account is selected.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contentLocation	varchar2	Content Location	☐	The uri from w here the client can get the response from the background API operation, if any is available.
errorMessage	varchar2	Error Message	☐	Any error message during processing of background API operation request. Note that any error response from the actual endpoint can be obtained by calling the ContentLocation address from the w ebhook

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				notifaction response or the background state document.
finishedUtc	datetime	Finished (UTC)	☐	Time when background API operation was finished processing
hasRequestContent	char	Has Request Content	☐	Indicates whether or not the background API operation request has a request content.
hasResponseContent	char	Has Response Content	☐	Indicates whether or not the background API operation ended with a response content. Value is updated only when background API operation is finished.
id	varchar2	ID	☐	Identifies a started background API operation
originalUri	varchar2		☐	The endpoint that was requested to be processed as a background API operation.
receivedUtc	datetime		☐	Time when background API operation was requested
reference	varchar2		☐	
responseHeaders	varchar2		☐	Any response headers from the finished background API operation.
startedUtc	datetime		☐	Time when processing of background API operation was started
status	varchar2	Status	☐	Current status of a background API operation. Possible values are 'Started', 'Finished' and 'Failed'.
statusCode	int32		☐	The Http Status Code of the finished background API operation. Value is 0 when operation is not done.
webhookAddress	varchar2		☐	The webhook uri used to notify when background API operation is finished, or 'none' if no notification is configured

3.1.7 Schema: Budget

3.1.7.1 Tables

BudgetPeriods: Visma.net Financials Budget Periods

Get a range of General Ledger Budget Figures - ScreenId=GL302010

Catalog: VismaNet

Schema: Budget

Label: Budget Periods

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BudgetPeriods. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☑		Mandatory. Filter by budgets Branch.
financialYear		☑		The budgets financial year.
greaterThanValue		☐		Filter by from date.
isReleased		☐		True to get released budgets.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
ledger		☑		Mandatory. The budgets Ledger
orderBy		☐		Order by Last modified date and time.
subaccount		☐		The Subaccount of the budget article.

Columns of Table Function

The columns of the table function BudgetPeriods are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

CashAccountEntryTypesByAccountNumber: Visma.net Financials Cash Account Entry Types by Account Number

Get a specific cash account

Catalog: VismaNet

Schema: CashAccount

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Label: Cash Account Entry Types by Account Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashAccountEntryTypesByAccountNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

CashSaleApplicationsByDocumentNumber: Visma.net Financials Cash Sales Applications by Document Number

Get a specific Cash SaleData for Cash Sale The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: CashSale

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Label: Cash Sales Applications by Document Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSaleApplicationsByDocumentNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

CashSaleLines: Visma.net Financials Cash Sale Lines

Get a range of Cash Sales - ScreenId=AR304000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2021-October:Added forced pagination

Catalog: VismaNet

Schema: CashSale

Label: Cash Sale Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSaleLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.

vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CashSaleLinesByDocumentNumber: Visma.net Financials Cash Sales Lines by Document Number

Get a specific Cash SaleData for Cash Sale The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: CashSale

Label: Cash Sales Lines by Document Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSaleLinesByDocumentNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentNumber		☑		Identifies the Cash Sale Document

Columns of Table Function

The columns of the table function CashSaleLinesByDocumentNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.
deferralCode	varchar2		☐	The deferral code assigned to the stock item or non-stock item specified in thisdocument line.Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		☐	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It show s the identifier of the deferral schedule associated w ith the original Cash sale document.
description	varchar2	Description	☐	Transaction descr. > Any brief comment relevant to the transaction.The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, w hich the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
discountAmount	double		☐	Discount amount > The amount of the line-level discount that has been applied manually orautomatically to this line.The system selects the Manual Discount check boxand calculates the line amount after you have entered the discount amountmanually and save your changes or added a new line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	varchar2	Discount Code	☐	The code of the line discount that has been applied to this line automatically or manually.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountPercent	double	Discount Percent	☐	Discount percent > The percent of the line-level discount that has been applied manually orautomatically.The system selects the Manual Discount check box andcalculates the discount amount after you have entered the percent manually andsaved your changes or added a new line.
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date when the customer ledger document was created.By default, for a new document, it is the current business date, but you can change the date.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
errorInfo	varchar2	Error Message	☐	
externalLink	varchar2		☐	
financialPeriod	varchar2	Financial Period	☐	The financial period to which the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document with the On Hold status may be edited and cannot be released.
inventoryNumber	varchar2	Inventory Number	☐	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	varchar2	Invoice Address County ID	☐	Click the magnifier > The identifier
invoiceAddress_county_name	varchar2	Invoice Address County Name	☐	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	char		☐	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	varchar2	Invoice Address Postal Code	☐	Postcode > The postcode.
invoiceContact_attention	varchar2	Invoice Contact Attention	☐	
invoiceContact_businessName	varchar2		☐	
invoiceContact_contactId	int32	Invoice Contact ID	☐	
invoiceContact_email	varchar2	Invoice Contact Email Address	☐	
invoiceContact_overrideContact	char		☐	
invoiceContact_phone1	varchar2	Invoice Contact Phone 1	☐	
invoiceText	varchar2	Invoice Text	☐	The top part > Invoice text > Any user-provided description of the customer ledger document.
lastModifiedDateTime	datetime	Last Modified	☐	System generated field for last modification date/time of document.
lineNumber	int32	Line Number	☐	Line no. > A counter of lines in the overview of cash sales document overview .
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualAmount	double	Manual Amount	☐	Manual amount > a check box indicating that the amount has been entered manually.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
manualAmountInCurrency	double		☐	Background calculation giving you the Manual amount in your default currency. This field is applicable if the amount is given in another currency than your default.
manualDiscount	char	Manual Discount	☐	Manual discount > A check box that indicates (if selected) that the discount has been appliedmanually.If you clear the check box, the system clears entered discount percent,or discount amount, or selected discount code.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	Icon Notes on top of the w indow > Pop-up w indow for providing any user-defined text connected to the document.
note	varchar2	Note	☐	Table > Icon Notes > Pop-up w indow for providing any user-defined text connected to the order.
origInvoiceDate	datetime	Original Invoice Date	☐	The top part > Orig invoice date > The date based on w hich the Due date and Cash discount date is calculated. Only used if setting "Use Orig Invoice Date" is active in AR Preferences.By default, for a new document, it is the current business date, but you can change the date.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentReference	varchar2	Payment Reference	☐	///The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance w ith the number series assigned to cash sales in the Customer ledger preferences w indow ..
postPeriod	varchar2	Post Period	☐	The top part > Post period > The period to w hich the document should be posted. Format YYYYMM.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
quantity	double	Quantity	☐	Quantity > The quantity of items (goods or services) of a particular type sold to the customer.
referenceNumber	varchar2	Reference Number	☐	The Top part > Ref. no. > The reference number of the customer ledger document in the system.
revoked	char	Revoke	☐	
salesPerson_2_description	varchar2	Salesperson 2 Description	☐	Click on the magnifier. > The description.
salesPerson_2_id	varchar2	Salesperson 2 ID	☐	Click on the magnifier. > The identifier.
salesperson	varchar2	Salesperson	☐	The field is deprecated for customer document endpoints, please use Seller instead
salesPersonDescr	varchar2	Sales Person Name	☐	The field is deprecated for customer document endpoints, please use SalesPerson instead
salesPersonID	int32	Sales Person ID	☐	The field is deprecated for customer document endpoints, please use SalesPerson instead
seller_description	varchar2	Seller Description	☐	Click on the magnifier. > The description.
seller_id	varchar2	Seller ID	☐	Click on the magnifier. > The identifier.
status	varchar2	Status	☐	The top part > Status > The status of the document, w hich can be one of the follow ing: Hold, Balanced, Voided, Scheduled, Open, Closed, Pending print, Pending email.
subaccount_active_2	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description_2	varchar2	Sub Account Description 2	☐	Description > The description of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo_2	varchar2	Sub Account Error Information 2	☐	
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime_2	datetime	Sub Account Last Modified Date/Time 2	☐	System generated information.
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize_2	int64	Sub Account Metadata Max Pagesize 2	☐	
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

subaccount_metadata_totalCount_2	int64	Sub Account Metadata Total Count 2	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId_2	int32	Sub Account ID 2	☐	SubID > The identifier of the subaccount.
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber_2	varchar2	Sub Account Number 2	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp_2	blob		☐	The timestamp of the subaccount, used for concurrency control.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
unitPrice	double		☐	Unit price > The unit price set for the item or service. If you w ant to update the unit priceautomatically to the current value(that is, the applicable sales or default price),you can use the Recalculate Prices and Discounts action.If you have modifiedthe unit price and saved the document, the value w ill not be updated by thesystem if you change the document date.
unitPriceInCurrency	double	Unit Price in Currency	☐	Background calculation giving you the Unit price in your default currency. This field is applicable if the amount is given in another currency than your default.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure (UoM) for the item.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CashSaleLineSubaccountSegments: Visma.net Financials Cash Sales Line Subaccount Segments

Get a range of Cash Sales - ScreenId=AR304000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2021-October:Added forced pagination

Catalog: VismaNet

Schema: CashSale

Label: Cash Sales Line Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSaleLineSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):*

This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CashSaleLineSubaccountSegmentsByDocumentNumber: Visma.net Financials Cash Sales Line Subaccount Segments by Document Number

Get a specific Cash SaleData for Cash Sale The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: CashSale

Label: Cash Sales Line Subaccount Segments by Document Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSaleLineSubaccountSegmentsByDocumentNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentNumber		☑		Identifies the Cash Sale Document

Columns of Table Function

The columns of the table function CashSaleLineSubaccountSegmentsByDocumentNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active_2	char	Account Active 2	☐	
account_active	char	Account Active	☐	
account_description_2	varchar2	Account Description 2	☐	Name of item/description
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1_2	varchar2	Account External Code 1 2	☐	Account class > The identifier of the account class.
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2_2	varchar2	Account External Code 2 2	☐	Account class > The name of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number_2	varchar2	Account Number 2	☐	Number of item
account_number	varchar2	Account Number	☐	Number of item
account_type_2	varchar2	Account Type 2	☐	Account > The account number.
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount_2	double		☐	The top part > Amount > The amount paid by the

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSales. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Catalog: VismaNet

Schema: CashSale

Label: Cash Sale Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashSaleSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CashSaleSubaccountSegmentsByDocumentNumber: Visma.net Financials Cash Sale Subaccount Segments by Document Number

Get a specific Cash SaleData for Cash Sale The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: CashSale

Label: Cash Sale Subaccount Segments by Document Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function CashSaleSubaccountSegmentsByDocumentNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentNumber		☑		Identifies the Cash Sale Document

CashTransactionDetailOffsetSubAccountSegments: Visma.net Financials Cash Transaction Detail Offset Subaccount Segments

Get all Transaction - ScreenID=CA304000Data for the Cash Transaction

Catalog: VismaNet

Schema: CashTransaction

Label: Cash Transaction Detail Offset Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashTransactionDetailOffsetSubAccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.

CashTransactionDetailsByReferenceNumber: Visma.net Financials Cash Transaction Details by Reference Number

Get a specific Transaction - ScreenID=CA304000Data for the Cash Transaction The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: CashTransaction

Label: Cash Transaction Details by Reference Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashTransactionDetailsByReferenceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Schema: CashTransaction

Label: Cash Transaction Tax Details by Reference Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CashTransactionTaxDetailsByReferenceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
referenceNbr		☑		Returns data for the selected Cash transaction

Columns of Table Function

The columns of the table function CashTransactionTaxDetailsByReferenceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The top part > Amount > The amount of the transaction.
cashAccount_description	varchar2	Cash Account Description	☐	Name of item/description
cashAccount_number	varchar2	Cash Account Number	☐	Number of item
cashAccount_type	varchar2	Cash Account Type	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlTotal	double	Total for Control	☐	Mandatory field: The top part > Control total > The control total of the transaction.
currency	varchar2	Currency	☐	The top part > Currency > The currency of the cash account.
deductibleTaxRate	double		☐	Deductible VAT rate > The percent of deduction that applies to the VAT amount paid to the supplier for specific purchases.
description	varchar2	Description	☐	The top part > Description > A detailed description of the transaction.
disbReceipt	varchar2		☐	The top part > Disb./receipt > The basic type of the transaction.
documentRef	varchar2	Document Reference	☐	The top part > Document ref. > The external document reference number.
entryType_description	varchar2	Entry Type Description	☐	Click on the magnifier. > The description.
entryType_id	varchar2	Entry Type ID	☐	Click on the magnifier. > The identifier.
expenseAmount	double		☐	Expense amount > The percentage that is deducted from the VAT amount paid to the supplier for specific purchases.
financialPeriod	varchar2	Financial Period	☐	Mandatory field: The top part > Period* > The financial period

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				to which the transaction should be posted.
financialsDetail_batchNumber	varchar2	Financials Detail Batch Number	☐	Link to general ledger section > Batch number > The number of the batch generated to implement the cash transaction.
financialsDetail_branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
financialsDetail_branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
financialsDetail_clearDate	datetime	Clear Date	☐	Link to general ledger section > Clear date > The date when the transaction was cleared.
financialsDetail_cleared	char	Cleared?	☐	Link to general ledger section > Cleared > A check box that indicates (if selected) that the transaction was cleared.
financialsDetail_taxCalcMode	varchar2	Tax Calculation Mode	☐	VAT settings section > VAT calculation > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document.
financialsDetail_taxZone_defaultTaxCategory_description	varchar2	Tax Zone Default Tax Category Description	☐	Name of item/description
financialsDetail_taxZone_defaultTaxCategory_number	varchar2	Tax Zone Default Tax Category Number	☐	Number of item
financialsDetail_taxZone_defaultVatCategory	varchar2	Tax Zone Default VAT Category	☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
financialsDetail_taxZone_description	varchar2	Tax Zone Description	☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
financialsDetail_taxZone_errorInfo	varchar2		☐	
financialsDetail_taxZone_id	varchar2	Tax Zone ID	☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
financialsDetail_taxZone_metadata_maxPageSize	int64		☐	
financialsDetail_taxZone_metadata_totalCount	int64		☐	
finPeriod	varchar2	Financial Period	☐	The property is now considered obsolete. Use Financial Period instead
hold	char	Hold	☐	The top part > Hold > A check box that, if selected, indicates that the transaction is

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				on hold, which means it may be edited but cannot be released.
includeInVatExemptTotal	char		☐	Include in VAT exempt total > A check box that indicates (if selected) that this value-added VAT has a zero rate and is used to calculate a document subtotal that is actually exempt from VAT.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
owner_internalId	varchar2	Owner Internal ID	☐	
owner_name	varchar2	Owner Name	☐	The name of the particular destination of the selected type.
owner_number	varchar2	Owner Number	☐	The identifier of the particular destination of the selected type.
pendingVat	char		☐	Pending VAT > A check box that indicates (if selected) that the VAT that should be calculated in documents, but should not be recorded to the VAT report until the VAT invoice is received.
referenceNbr	varchar2	Reference Number	☐	The top part > Ref. no. > The unique identifier assigned to the cash transaction in accordance with the numbering sequence.
reverseVat	char	Reverse VAT	☐	Reverse VAT > A check box that indicates (if selected) that this is a reverse VAT.
statisticalVat	char	Statistical VAT	☐	Statistical VAT > A check box that indicates (if selected) that the VAT on documents will be calculated only for statistical purposes or will be reported only but not actually paid.
status	varchar2	Status	☐	The top part > Status > The status of the transaction, which is automatically assigned by the system.
tax_description	varchar2	Tax Description	☐	Name of item/description
tax_number	varchar2	Tax Number	☐	Number of item
taxableAmount	double	Taxable Amount	☐	Taxable amount > The taxable amount of the transaction.
taxAmount_2	double		☐	The top part > VAT amount > The VAT amount to be paid for the document. A user enters this amount manually.
taxAmount	double	Tax Amount	☐	VAT amount > The VAT amount calculated for the transaction.
taxRate	double	Tax Rate	☐	VAT rate > The rate of the VAT.
taxTotal	double	Tax Total	☐	The top part > VAT total > The total amount of tax paid in

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				the document.
taxType	varchar2	Tax Type	☐	VAT type > The type of VAT.
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
tranDate	datetime	Transaction Date	☐	Mandatory field: The top part > Trans. date* > The date of the transaction.
tranType	varchar2	Transaction Type	☐	The top part > Trans type > The type of cash transaction.
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt total > The document total that is exempt from VAT.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.

3.1.14.1 Tables

ContractUsages: Visma.net Financials Contract Usages

Get a range of Contract Usage - ScreenId=CT303000

Catalog: VismaNet

Schema: ContractUsage

Label: Contract Usages

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ContractUsages. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

CreditNoteApplicationsByCreditNoteNumber: Visma.net Financials Credit Note Applications by Credit Note Number

Get a specific Credit Note - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Applications by Credit Note Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteApplicationsByCreditNoteNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
creditNoteNumber		☑		Identifies the Credit Note

CreditNoteAttachmentsByNumber: Visma.net Financials Credit Note Attachments by Number

Get a specific Credit Note - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Attachments by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteAttachmentsByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Label	Required	Documentation
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CreditNoteInvoiceLineAttachmentsByNumber: Visma.net Financials Credit Note Invoice Line Attachments by Number

Get a specific Credit Note - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Invoice Line Attachments by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function CreditNoteInvoiceLineAttachmentsByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount_2	int64	Sub Account Metadata Total Count 2	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId_2	int32	Sub Account ID 2	☐	SubID > The identifier of the subaccount.
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber_2	varchar2	Sub Account Number 2	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp_2	blob		☐	The timestamp of the subaccount, used for concurrency control.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
unitPrice	double		☐	Unit price > The unit price set for the item or service. If you want to update the unit priceautomatically to the current value(that is, the applicable sales or default price),you can use the Recalculate Prices and Discounts action.If you have modifiedthe unit price and saved the document, the value will not be updated by thesystem if you change the document date.
unitPriceInCurrency	double	Unit Price in Currency	☐	Background calculation giving you the Unit price in your default currency. This field is applicable if the amount is given in another currency than your default.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure (UoM) for the item.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax with the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CreditNoteInvoiceLinesAttachments: Visma.net Financials Credit Note Invoice Line Attachments

Get a range of Credit Notes - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Invoice Line Attachments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteInvoiceLinesAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:*

vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CreditNoteInvoiceLinesByNumber: Visma.net Financials Credit Note Invoice Lines by Number

Get a specific Credit Note - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Invoice Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteInvoiceLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
creditNoteNumber		☑		Identifies the Credit Note

Columns of Table Function

The columns of the table function CreditNoteInvoiceLinesByNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active_2	char	Account Active 2	☐	
account_active	char	Account Active	☐	
account_description_2	varchar2	Account Description 2	☐	Name of item/description
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1_2	varchar2	Account External Code 1 2	☐	Account class > The identifier of the account class.
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2_2	varchar2	Account External Code 2 2	☐	Account class > The name of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number_2	varchar2	Account Number 2	☐	Number of item
account_number	varchar2	Account Number	☐	Number of item
account_type_2	varchar2	Account Type 2	☐	Account > The account number.
account_type	varchar2	Account Type	☐	Account > The account number.
amount_2	double		☐	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 w indow .If the check box is cleared, then the value appears w hen the document status is Open.
amount	double	Amount	☐	Amount > The amount after the discount has been applied. The value of this read-only boxis calculated automatically by deducting the discount amount from the extended price.
amountInCurrency_2	double	Amount in Currency 2	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount w as taken. For a

This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CreditNoteInvoiceLineSubaccountSegments: Visma.net Financials Credit Note Invoice Line Subaccount Segments

Get a range of Credit Notes - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Invoice Line Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteInvoiceLineSubaccountSegments. A value must be provided at all times for

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.

customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.
deferralCode	varchar2		☐	The deferral code assigned to the stock item or non-stock item specified in thisdocument line.Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		☐	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It show s the identifier of the deferral schedule associated w ith the original Cash sale document.
description_2	varchar2	Description 2	☐	Transaction descr. > Any brief comment relevant to the transaction.The alphanumeric string may contain up to 30 characters.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, w hich the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
discountAmount	double		☐	Discount amount > The amount of the line-level discount that has been applied manually orautomatically to this line.The system selects the Manual Discount check boxand calculates the line amount after you have entered the discount amountmanually and save your changes or added a new line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				in another currency than your default.
discountCode	varchar2	Discount Code	☐	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	☐	Discount percent > The percent of the line-level discount that has been applied manually orautomatically.The system selects the Manual Discount check box andcalculates the discount amount after you have entered the percent manually andsaved your changes or added a new line.
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date when the customer ledger document was created.By default, for a new document, it is the current business date, but you can change the date.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
externalLink	varchar2		☐	
externalReference	varchar2	External Reference	☐	
financialPeriod	varchar2	Financial Period	☐	The financial period to which the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document with the On Hold status may be edited and cannot be released.
inventoryNumber	varchar2	Inventory Number	☐	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	varchar2	Invoice Address County ID	☐	Click the magnifier > The identifier
invoiceAddress_county_name	varchar2	Invoice Address County Name	☐	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	char		☐	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	varchar2	Invoice Address Postal Code	☐	Postcode > The postcode.
invoiceContact_attention	varchar2	Invoice Contact Attention	☐	
invoiceContact_businessName	varchar2		☐	
invoiceContact_contactId	int32	Invoice Contact ID	☐	
invoiceContact_email	varchar2	Invoice Contact Email Address	☐	
invoiceContact_overrideContact	char		☐	
invoiceContact_phone1	varchar2	Invoice Contact Phone 1	☐	
invoiceText	varchar2	Invoice Text	☐	The top part > Invoice text > Any user-provided description of the customer ledger document.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	System generated field for last modification date/time of document.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineNumber	int32	Line Number	☐	Line no. > A counter of lines in the overview of cash sales document overview .

vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CreditNoteInvoiceLineSubaccountSegmentsByCreditNoteNumber: Visma.net Financials Credit Note Invoice Line Subaccount Segments by Credit Note Number

Get a specific Credit Note - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Invoice Line Subaccount Segments by Credit Note Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteInvoiceLineSubaccountSegmentsByCreditNoteNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNotes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.

CreditNoteSubaccountSegments: Visma.net Financials Credit Note Subaccount Segments

Get a range of Credit Notes - Method is deprecated start using the new method in endpoint Customer Credit Note

Catalog: VismaNet

Schema: CreditNote

Label: Credit Note Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditNoteSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.

3.1.17 Schema: CreditTerm

3.1.17.1 Tables

CreditTermRecordInstalmentsSchedule: Visma.net Financials Credit Term Record Instalment Schedules

Get a range of credit terms - ScreenId=CS206500

Catalog: VismaNet

Schema: CreditTerm

Label: Credit Term Record Instalment Schedules

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CreditTermRecordInstalmentsSchedule. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and

CustomerAttributesByCode: Visma.net Financials Customer Attributes by Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer Attributes by Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerAttributesByCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

CustomerAttributesByInternalId: Visma.net Financials Customer Atributes by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer Atributes by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerAttributesByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerAttributesByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and want to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated with the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by which the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit

CustomerBalanceByCustomerCode: Visma.net Financials Customer Balance by Customer Code

Get a specific customer's balance - ScreenId=AR303000

Catalog: VismaNet

Schema: Customer

Label: Customer Balance by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerBalanceByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer for w hich to return data

Columns of Table Function

The columns of the table function CustomerBalanceByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

CustomerByInternalId: Visma.net Financials Customer by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Catalog: VismaNet

Schema: Customer

Label: Customer by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers

CustomerCashSaleLinesForCustomerByCustomerNumber: Visma.net Financials Customer Cash Sales Lines by Customer Number

Get a range of cash sales for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Cash Sales Lines by Customer Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerCashSaleLinesForCustomerByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.

Name	Data Type	Label	Required	Documentation
				another currency than your default.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount w as taken. For a document used in the application process, this is the balance after the payments w ere applied.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount that has been or w ill be taken on the document, w hich the system calculates based on the specified credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	Cost > The total cost of the line in default currency. The value w ill alw ays be 0 for unreleased documents.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
createdDateTime	datetime	Created	☐	The Attachments tab > Creation time > The date the attachment w as created.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency of the document. By default, it is the customer's default currency,but it can be changed if the Allow Currency Override check box is selected in the AR303000 w indow .
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.
deferralCode	varchar2		☐	The deferral code assigned to the stock item or non-stock item specified in thisdocument line.Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		☐	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It show s the identifier of the deferral schedule associated w ith the original Cash sale document.
description	varchar2	Description	☐	Transaction descr. > Any brief comment relevant to the transaction.The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, w hich the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountAmount	double		☐	Discount amount > The amount of the line-level discount that has been applied manually orautomatically to this line.The system selects the Manual Discount check boxand calculates the line amount after you have entered the discount amountmanually and save your changes or added a new line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	varchar2	Discount Code	☐	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	☐	Discount percent > The percent of the line-level discount that has been applied manually orautomatically.The system selects the Manual Discount check box andcalculates the discount amount after you have entered the percent manually andsaved your changes or added a new line.
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date w hen the customer ledger document w as created.By default, for a new document, it is the current business date, but you can change the date.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The follow ing types are available: invoice, debit note, credit note, overdue charge, credit w rite-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
errorInfo	varchar2	Error Message	☐	
externalLink	varchar2		☐	
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.

CustomerCashSaleLineSubaccountSegmentsByCustomerNumber: Visma.net Financials Customer Cash Sales Line Subaccount Segments by Customer Number

Get a range of cash sales for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Cash Sales Line Subaccount Segments by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerCashSaleLineSubaccountSegmentsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

				document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerCashSalesApplicationsByCustomerNumber: Visma.net Financials Customer Cash Sales Applications by Customer Number

Get a range of cash sales for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Cash Sales Applications by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerCashSalesApplicationsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.

CustomerCashSalesForCustomerByCustomerNumber: Visma.net Financials Customer Cash Sales by Customer Number

Get a range of cash sales for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Cash Sales by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function CustomerCashSalesForCustomerByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerCashSaleSubaccountSegmentsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time,

Columns of Table Function

The columns of the table function CustomerCashSaleSubaccountSegmentsByCustomerNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 w indow .If the check box is cleared, then the value appears w hen the document status is Open.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount w as taken. For a document used in the application process, this is the balance after the payments w ere applied.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash

Name	Data Type	Label	Required	Documentation
				account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount that has been or w ill be taken on the document, w hich the system calculates based on the specified credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
createdDateTime	datetime	Created	☐	The Attachments tab > Creation time > The date the attachment w as created.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency of the document. By default, it is the customer's default currency,but it can be changed if the Allow Currency Override check box is selected in the AR303000 w indow .
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, w hich the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date when the customer ledger document was created.By default, for a new document, it is the current business date, but you can change the date.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
financialPeriod	varchar2	Financial Period	☐	The financial period to which the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document with the On Hold status may be edited and cannot be released.
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐

CustomerContactsForCustomerByCustomerCode: Visma.net Financials Customer Contacts by Customer Code

Get a range of Contacts of a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Contacts by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerContactsForCustomerByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
active		☐

title	varchar2	Title	☐	The top part > First name > The contact's courtesy title.
web	varchar2	Web	☐	The Details tab > Contact section > Web > The website of the contact, if any.

CustomerDirectDebitByCustomerCode: Visma.net Financials Customer Direct Debit by Customer Code

Get direct debit information for a specific customer(only for Netherlands)

Catalog: VismaNet

Schema: Customer

Label: Customer Direct Debit by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDirectDebitByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer for which to return data

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Columns of Table Function

The columns of the table function CustomerDirectDebitByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
bic	varchar2	BIC	☐	
branch	varchar2	Branch	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.

CustomerDirectDebitLinesByCode: Visma.net Financials Customer Direct Debit Lines by Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer Direct Debit Lines by Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDirectDebitLinesByCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerDirectDebitLinesByCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
bic	varchar2	BIC	☐	
branch	varchar2	Branch	☐

CustomerDirectDebitLinesByInternalId: Visma.net Financials Customer Direct Debit Lines by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer Direct Debit Lines by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDirectDebitLinesByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

CustomerDocumentsForCustomerByCustomerNumber: Visma.net Financials Customer Documents by Customer Number

Gets a range of documents for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Documents by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDocumentsForCustomerByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DocumentDate__

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				and __DocumentDateCondition__ are __mutually inclusive__.
documentDueDate		☐		The date w hen payment for the document is due, in accordance w ith the credit terms.
documentDueDateCondition		☐		This value represents the condition to be applied to the Due Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal
documentType		☐		The field is deprecated for specific customer document endpoints. It w ill only be usable from customer document endpoint. (Values: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime		☐		The date and time for w hen the document last released a dunning letter.
dunningLetterDateTimeCondition		☐		Set time/date as before (<), after (>), before and including (=<) OR after and including (=>) to filter on time frame.
dunningLevel		☐		The dunning level of the document.
expandApplications		☐		True if you w ant to see all dunning information regarding this document.
expandAttachments		☐		True if you w ant to see all attachments regarding this document.
expandDunningInformation		☐		
expandInvoiceAddress		☐		True if you w ant to see all information regarding the invoice address for this document.
expandTaxDetails		☐		True if you w ant to see all VAT details regarding this document.
externalReference		☐		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod		☐		The financial period to w hich the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
paymentReference		☐		The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance w ith the number series assigned to cash sales in the Customer ledger preferences w indow ..
project		☐		The project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document. Use the dropdow n to select status. (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, PendingPrint, PendingEmail, CreditHold, CcHold, Reserved)

Columns of Table Function

The columns of the table function CustomerDocumentsForCustomerByCustomerNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 w indow .If the check box is cleared, then the value appears w hen the document status is Open.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount w as taken. For a document used in the application process, this is the balance after the payments w ere applied.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount that has been or w ill be taken on the document, w hich the system calculates based on the specified credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
createdDateTime	datetime	Created	☐	The Attachments tab > Creation time > The date the attachment w as created.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency of the document. By default, it is the customer's default currency,but it can be changed if the Allow Currency Override check box is selected in the AR303000 w indow .
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.
documentDate	datetime	Document Date	☐	The top part > Date* > The date w hen the customer ledger document w as created.By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	☐	
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The follow ing types are available: invoice, debit note, credit note, overdue charge, credit w rite-off
errorInfo	varchar2	Error Message	☐	
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
invoiceText	varchar2	Invoice Text	☐	The top part > Invoice text > Any user-provided description of the customer ledger document.
lastModifiedDateTime	datetime	Last Modified	☐	System generated field for last modification date/time of document.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note	varchar2	Note	☐	Icon Notes on top of the w indow > Pop-up w indow for providing any user-defined text connected to the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The top part > Orig invoice date > The date based on w hich the Due date and Cash discount date is calculated. Only used if setting "Use Orig Invoice Date" is active in AR Preferences.By default, for a new document, it is the current business date, but you can change the date.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
postPeriod	varchar2	Post Period	☐	The top part > Post period > The period to w hich the document should be posted. Format YYYYMM.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
referenceNumber	varchar2	Reference Number	☐	The Top part > Ref. no. > The reference number of the customer ledger document in the system.
status	varchar2	Status	☐	The top part > Status > The status of the document, w hich can be one of the follow ing: Hold, Balanced, Voided, Scheduled, Open, Closed, Pending print, Pending email.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerDocumentSubaccountSegmentsByCustomerNumber: Visma.net Financials Customer Document Subaccount Segments by Customer Number

Gets a range of documents for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Document Subaccount Segments by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerDocumentSubaccountSegmentsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDueDate		☐		The date w hen payment for the document is due, in accordance

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				with the credit terms.
documentDueDateCondition		☐		This value represents the condition to be applied to the Due Date when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal
documentType		☐		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Values: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime		☐		The date and time for when the document last released a dunning letter.
dunningLetterDateTimeCondition		☐		Set time/date as before (<), after (>), before and including (=<) OR after and including (=>) to filter on time frame.
dunningLevel		☐		The dunning level of the document.
expandApplications		☐		True if you want to see all dunning information regarding this document.
expandAttachments		☐		True if you want to see all attachments regarding this document.
expandDunningInformation		☐		
expandInvoiceAddress		☐		True if you want to see all information regarding the invoice address for this document.
expandTaxDetails		☐		True if you want to see all VAT details regarding this document.
externalReference		☐		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod		☐		The financial period to which the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue		☐		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
paymentReference		☐		The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance w ith the number series assigned to cash sales in the Customer ledger preferences w indow ..
project		☐		The project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document. Use the dropdow n to select status. (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, PendingPrint, PendingEmail, CreditHold, CcHold, Reserved)

Columns of Table Function

The columns of the table function CustomerDocumentSubaccountSegmentsByCustomerNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 window .If the check box is cleared, then the value appears when the document status is Open.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount was taken. For a document used in the application process, this is the balance after the payments were applied.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given

vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerGlAccountCashDiscountSubaccountSegments: Visma.net Financials Customer GL Account Cash Discount Subaccount Segments

Get a range of customers - ScreenId=AR303000

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Cash Discount Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountCashDiscountSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		
greaterThanValue		☐		This field does not w ork and has been deprecated. It w ill be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-

CustomerGlAccountCashDiscountSubaccountSegmentsByCustomerCode: Visma.net Financials Customer GL Account Cash Discount Subaccount Segments by Customer Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Cash Discount Subaccount Segments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountCashDiscountSubaccountSegmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountCashDiscountSubaccountSegmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers

CustomerGlAccountCashDiscountSubAccountSegmentsByInternalId: Visma.net Financials Customer GL Account Cash Discount Sub Account Segments by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Cash Discount Sub Account Segments by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountCashDiscountSubAccountSegmentsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountCashDiscountSubAccountSegmentsByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers

CustomerGlAccountCustomerLedgerSubaccountSegments: Visma.net Financials Customer GL Account Customer Ledger Subaccount Segments

Get a range of customers - ScreenId=AR303000

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Customer Ledger Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountCustomerLedgerSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		
greaterThanValue		☐		This field does not work and has been deprecated. It will be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
name		☐		Contains Customer name.
phone		☐		Equals Phone 1 for customer.
status		☐		Drop down and select Status. (Values: Active, OnHold, CreditHold, Inactive, OneTime)
vatRegistrationId		☐		Equals VAT registration ID from Delivery settings tab.

Columns of Table Function

The columns of the table function CustomerGlAccountCustomerLedgerSubaccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and want to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account

CustomerGlAccountCustomerLedgerSubaccountSegmentsByCustomerCode: Visma.net Financials Customer GL Account Customer Ledger Subaccount Segments by Customer Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Customer Ledger Subaccount Segments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountCustomerLedgerSubaccountSegmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountCustomerLedgerSubaccountSegmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.

CustomerGlAccountCustomerLedgerSubAccountSegmentsByInternalId: Visma.net Financials Customer GL Account Customer Ledger Sub Account Segments by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Schema: Customer

Label: Customer GL Account Customer Ledger Sub Account Segments by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountCustomerLedgerSubAccountSegmentsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountCustomerLedgerSubAccountSegmentsByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountDiscountSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:__ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				__CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		
greaterThanValue		☐		This field does not work and has been deprecated. It will be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
name		☐		Contains Customer name.
phone		☐		Equals Phone 1 for customer.
status		☐		Drop down and select Status. (Values: Active, OnHold, CreditHold, Inactive, OneTime)
vatRegistrationId		☐		Equals VAT registration ID from Delivery settings tab.

Columns of Table Function

The columns of the table function CustomerGlAccountDiscountSubaccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and want to

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
cashDiscountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
cashDiscountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
cashDiscountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated w ith the location.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by w hich the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit rule applied to this customer. The follow ing options are available: Days past due, Credit limit, Limit and days past due, disabled.
currencyId	varchar2	Currency ID	☐	The General information tab > Financial settings section > Currency ID > The currency used in operations w ith the customer, w hich you can select from the list of currencies defined in the system.
customerClass_description	varchar2	Customer Class Description	☐	Click on the magnifier. > The description.
customerClass_id	varchar2	Customer Class ID	☐	Click on the magnifier. > The identifier.
customerLedgerAccount_description	varchar2		☐	Name of item/description
customerLedgerAccount_number	varchar2		☐	Number of item
customerLedgerAccount_type	varchar2		☐	
customerLedgerSubaccount_active	char		☐	Active > The status of the identifier.
customerLedgerSubaccount_description	varchar2		☐	Description > The description of the identifier.
customerLedgerSubaccount_errorInfo	varchar2		☐	
customerLedgerSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
customerLedgerSubaccount_metadata_maxPageSize	int64		☐	
customerLedgerSubaccount_metadata_totalCount	int64		☐

CustomerGlAccountDiscountSubaccountSegmentsByCustomerCode: Visma.net Financials Customer GL Account Discount Subaccount Segments by Customer Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Discount Subaccount Segments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountDiscountSubaccountSegmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountDiscountSubaccountSegmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to

CustomerGlAccountDiscountSubAccountSegmentsByInternalId: Visma.net Financials Customer GL Account Discount Sub Account Segments by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Discount Sub Account Segments by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountDiscountSubAccountSegmentsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountDiscountSubAccountSegmentsByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to

CustomerGlAccountFreightSubaccountSegments: Visma.net Financials Customer GL Account Freight Subaccount Segments

Get a range of customers - ScreenId=AR303000

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Freight Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountFreightSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		
greaterThanValue		☐		This field does not w ork and has been deprecated. It w ill be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
name		☐		Contains Customer name.
phone		☐		Equals Phone 1 for customer.
status		☐		Drop dow n and select Status. (Values: Active, OnHold, CreditHold, Inactive, OneTime)
vatRegistrationId		☐		Equals VAT registration ID from Delivery settings tab.

CustomerGlAccountFreightSubaccountSegmentsByCustomerCode: Visma.net Financials Customer GL Account Freight Subaccount Segments by Customer Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Freight Subaccount Segments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountFreightSubaccountSegmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The columns of the table function CustomerGlAccountFreightSubaccountSegmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and want to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description

CustomerGlAccountFreightSubAccountSegmentsByInternalId: Visma.net Financials Customer GL Account Freight Sub Account Segments by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Freight Sub Account Segments by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountFreightSubAccountSegmentsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountFreightSubAccountSegmentsByInternalId are shown below. Each column has an SQL data type.

vatZone_metadata_totalCount	int64		☐	

CustomerGlAccountPrepaymentSubaccountSegments: Visma.net Financials Customer GL Account Prepayment Subaccount Segments

Get a range of customers - ScreenId=AR303000

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Prepayment Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountPrepaymentSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		
greaterThanValue		☐		This field does not w ork and has been deprecated. It w ill be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
name		☐		Contains Customer name.
phone		☐		Equals Phone 1 for customer.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
status		☐		Drop dow n and select Status. (Values: Active, OnHold, CreditHold, Inactive, OneTime)
vatRegistrationId		☐		Equals VAT registration ID from Delivery settings tab.

Columns of Table Function

The columns of the table function CustomerGlAccountPrepaymentSubaccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
cashDiscountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
cashDiscountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
cashDiscountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated w ith the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by w hich the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit rule applied to this customer. The follow ing options are available: Days past due, Credit limit, Limit and days past due, disabled.
currencyId	varchar2	Currency ID	☐	The General information tab > Financial settings section > Currency ID > The currency used in operations w ith the customer, w hich you can select from the list of currencies defined in the system.
customerClass_description	varchar2	Customer Class Description	☐	Click on the magnifier. > The description.
customerClass_id	varchar2	Customer Class ID	☐	Click on the magnifier. > The identifier.

CustomerGlAccountPrepaymentSubaccountSegmentsByCustomerCode: Visma.net Financials Customer GL Account Prepayment Subaccount Segments by Customer Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Prepayment Subaccount Segments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountPrepaymentSubaccountSegmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountPrepaymentSubaccountSegmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.

CustomerGlAccountPrepaymentSubAccountSegmentsByInternalId: Visma.net Financials Customer GL Account Prepayment Sub Account Segments by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Prepayment Sub Account Segments by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountPrepaymentSubAccountSegmentsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountPrepaymentSubAccountSegmentsByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
cashDiscountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
cashDiscountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated with the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by which the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit rule applied to this customer. The following options are available: Days past due, Credit limit, Limit and days past due, disabled.
currencyId	varchar2	Currency ID	☐	The General information tab > Financial settings section > Currency ID > The currency used in operations with the customer, which you can select from the list of currencies defined in the system.
customerClass_description	varchar2	Customer Class Description	☐	Click on the magnifier. > The description.
customerClass_id	varchar2	Customer Class ID	☐	Click on the magnifier. > The identifier.
customerLedgerAccount_description	varchar2		☐	Name of item/description
customerLedgerAccount_number	varchar2		☐	Number of item
customerLedgerAccount_type	varchar2		☐	
customerLedgerSubaccount_active	char		☐	Active > The status of the identifier.

vatZone_metadata_totalCount	int64		☐	

CustomerGlAccountSalesSubaccountSegments: Visma.net Financials Customer GL Account Sales Subaccount Segments

Get a range of customers - ScreenId=AR303000

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Sales Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountSalesSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		
greaterThanValue		☐		This field does not w ork and has been deprecated. It w ill be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.

Name	Data Type	Required	Default Value	Documentation
name		☐		Contains Customer name.
phone		☐		Equals Phone 1 for customer.
status		☐		Drop dow n and select Status. (Values: Active, OnHold, CreditHold, Inactive, OneTime)
vatRegistrationId		☐		Equals VAT registration ID from Delivery settings tab.

Columns of Table Function

The columns of the table function CustomerGlAccountSalesSubaccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
cashDiscountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
cashDiscountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
cashDiscountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated w ith the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by w hich the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit rule applied to this customer. The follow ing options are available: Days past due, Credit limit, Limit and days past due, disabled.
currencyId	varchar2	Currency ID	☐	The General information tab > Financial settings section > Currency ID > The currency used in operations w ith the customer, w hich you can select from the list of currencies defined in the system.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customerClass_description	varchar2	Customer Class Description	☐	Click on the magnifier. > The description.
customerClass_id	varchar2	Customer Class ID	☐	Click on the magnifier. > The identifier.
customerLedgerAccount_description	varchar2		☐	Name of item/description
customerLedgerAccount_number	varchar2		☐	Number of item
customerLedgerAccount_type	varchar2		☐	
customerLedgerSubaccount_active	char		☐	Active > The status of the identifier.
customerLedgerSubaccount_description	varchar2		☐	Description > The description of the identifier.
customerLedgerSubaccount_errorInfo	varchar2		☐	
customerLedgerSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
customerLedgerSubaccount_metadata_maxPageSize	int64		☐	
customerLedgerSubaccount_metadata_totalCount	int64		☐	
customerLedgerSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
customerLedgerSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
customerLedgerSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
customerLedgerSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
customerLedgerSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
customerLedgerSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
customerLedgerSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
defaultPaymentMethodId	varchar2		☐	Invoicing settings tab > Default payment method section > The default payment method.
deliveryAddress_addressId	int32	Delivery Address ID	☐	
deliveryAddress_addressLine1	varchar2	Delivery Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
deliveryAddress_addressLine2	varchar2	Delivery Address Line 2	☐	Address 2 > The second line of the address.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deliveryAddress_addressLine3	varchar2	Delivery Address Line 3	☐	Address 3 > The third line of the address.
deliveryAddress_city	varchar2	Delivery Address City	☐	City > The city.
deliveryAddress_country_errorInfo	varchar2		☐	
deliveryAddress_country_id	varchar2	Delivery Address Country ID	☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
deliveryAddress_country_metadata_maxPageSize	int64		☐	
deliveryAddress_country_metadata_totalCount	int64		☐	
deliveryAddress_country_name	varchar2	Delivery Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
deliveryAddress_county_id	varchar2	Delivery Address County ID	☐	Click the magnifier > The identifier
deliveryAddress_county_name	varchar2	Delivery Address County Name	☐	Click the magnifier > The displayed name
deliveryAddress_postalCode	varchar2	Delivery Address Postal Code	☐	Postcode > The postcode.
deliveryContact_attention	varchar2	Delivery Contact Attention	☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
deliveryContact_contactId	int32	Delivery Contact ID	☐	
deliveryContact_email	varchar2	Delivery Contact Email Address	☐	Email > The email address of the customer/supplier/company as a business entity.
deliveryContact_fax	varchar2	Delivery Contact Fax	☐	Fax > The fax number.
deliveryContact_name	varchar2	Delivery Contact Name	☐	Name > The legal name of to appear on the documents.
deliveryContact_phone1	varchar2	Delivery Contact Phone 1	☐	Phone 1 > The default phone number.
deliveryContact_phone2	varchar2	Delivery Contact Phone 2	☐	Phone 2 > An additional phone number.
deliveryContact_web	varchar2	Delivery Contact Website	☐	Web > The website of the company, if one exists.
description	varchar2	Description	☐	Description > The description of the identifier.
discountAccount_description	varchar2		☐	Name of item/description
discountAccount_number	varchar2		☐	Number of item
discountAccount_type	varchar2		☐	
discountSubaccount_active	char		☐	Active > The status of the identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountSubaccount_description	varchar2		☐	Description > The description of the identifier.
discountSubaccount_errorInfo	varchar2		☐	
discountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
discountSubaccount_metadata_maxPageSize	int64		☐	
discountSubaccount_metadata_totalCount	int64		☐	
discountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
discountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
discountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
discountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
discountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
discountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
discountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
eInvoiceContract_fInvoiceContractID	varchar2		☐	
eInvoiceContract_fInvoiceIntermediatorID	varchar2		☐	
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
excludeDebtCollection	char		☐	Exclude Debt Collection for Autocollect
freightAccount_description	varchar2		☐	Name of item/description
freightAccount_number	varchar2		☐	Number of item
freightAccount_type	varchar2		☐	
freightSubaccount_active	char		☐	Active > The status of the identifier.
freightSubaccount_description	varchar2		☐	Description > The description of the identifier.
freightSubaccount_errorInfo	varchar2		☐	
freightSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
freightSubaccount_metadata_maxPageSize	int64		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
freightSubaccount_metadata_totalCount	int64		☐	
freightSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
freightSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
freightSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
freightSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
freightSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
freightSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
freightSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
gln	varchar2	GLN	☐	Delivery settings tab > Default location settings section > GLN > The Global Location Number, associated w ith the location.
internalId	int32	Internal ID	☐	
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Label: Customer GL Account Sales Subaccount Segments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountSalesSubaccountSegmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountSalesSubaccountSegmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
cashDiscountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
cashDiscountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
cashDiscountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated w ith the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by w hich the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit rule applied to this customer. The follow ing options are available: Days past due, Credit limit, Limit and days past due, disabled.
currencyId	varchar2	Currency ID	☐	The General information tab > Financial settings section > Currency ID > The currency used in operations w ith the customer, w hich you can select from the list of currencies defined in the system.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customerClass_description	varchar2	Customer Class Description	☐	Click on the magnifier. > The description.
customerClass_id	varchar2	Customer Class ID	☐	Click on the magnifier. > The identifier.
customerLedgerAccount_description	varchar2		☐	Name of item/description
customerLedgerAccount_number	varchar2		☐	Number of item
customerLedgerAccount_type	varchar2		☐	
customerLedgerSubaccount_active	char		☐	Active > The status of the identifier.
customerLedgerSubaccount_description	varchar2		☐	Description > The description of the identifier.
customerLedgerSubaccount_errorInfo	varchar2		☐	
customerLedgerSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
customerLedgerSubaccount_metadata_maxPageSize	int64		☐	
customerLedgerSubaccount_metadata_totalCount	int64		☐	
customerLedgerSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
customerLedgerSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
customerLedgerSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
customerLedgerSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
customerLedgerSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
customerLedgerSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
customerLedgerSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
defaultPaymentMethodId	varchar2		☐	Invoicing settings tab > Default payment method section > The default payment method.
deliveryAddress_addressId	int32	Delivery Address ID	☐	
deliveryAddress_addressLine1	varchar2	Delivery Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
deliveryAddress_addressLine2	varchar2	Delivery Address Line 2	☐	Address 2 > The second line of the address.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deliveryAddress_addressLine3	varchar2	Delivery Address Line 3	☐	Address 3 > The third line of the address.
deliveryAddress_city	varchar2	Delivery Address City	☐	City > The city.
deliveryAddress_country_errorInfo	varchar2		☐	
deliveryAddress_country_id	varchar2	Delivery Address Country ID	☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
deliveryAddress_country_metadata_maxPageSize	int64		☐	
deliveryAddress_country_metadata_totalCount	int64		☐	
deliveryAddress_country_name	varchar2	Delivery Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
deliveryAddress_county_id	varchar2	Delivery Address County ID	☐	Click the magnifier > The identifier
deliveryAddress_county_name	varchar2	Delivery Address County Name	☐	Click the magnifier > The displayed name
deliveryAddress_postalCode	varchar2	Delivery Address Postal Code	☐	Postcode > The postcode.
deliveryContact_attention	varchar2	Delivery Contact Attention	☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
deliveryContact_contactId	int32	Delivery Contact ID	☐	
deliveryContact_email	varchar2	Delivery Contact Email Address	☐	Email > The email address of the customer/supplier/company as a business entity.
deliveryContact_fax	varchar2	Delivery Contact Fax	☐	Fax > The fax number.
deliveryContact_name	varchar2	Delivery Contact Name	☐	Name > The legal name of to appear on the documents.
deliveryContact_phone1	varchar2	Delivery Contact Phone 1	☐	Phone 1 > The default phone number.
deliveryContact_phone2	varchar2	Delivery Contact Phone 2	☐	Phone 2 > An additional phone number.
deliveryContact_web	varchar2	Delivery Contact Website	☐	Web > The website of the company, if one exists.
description	varchar2	Description	☐	Description > The description of the identifier.
discountAccount_description	varchar2		☐	Name of item/description
discountAccount_number	varchar2		☐	Number of item
discountAccount_type	varchar2		☐	
discountSubaccount_active	char		☐	Active > The status of the identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountSubaccount_description	varchar2		☐	Description > The description of the identifier.
discountSubaccount_errorInfo	varchar2		☐	
discountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
discountSubaccount_metadata_maxPageSize	int64		☐	
discountSubaccount_metadata_totalCount	int64		☐	
discountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
discountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
discountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
discountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
discountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
discountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
discountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
eInvoiceContract_fInvoiceContractID	varchar2		☐	
eInvoiceContract_fInvoiceIntermediatorID	varchar2		☐	
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
excludeDebtCollection	char		☐	Exclude Debt Collection for Autocollect
freightAccount_description	varchar2		☐	Name of item/description
freightAccount_number	varchar2		☐	Number of item
freightAccount_type	varchar2		☐	
freightSubaccount_active	char		☐	Active > The status of the identifier.
freightSubaccount_description	varchar2		☐	Description > The description of the identifier.
freightSubaccount_errorInfo	varchar2		☐	
freightSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
freightSubaccount_metadata_maxPageSize	int64		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
freightSubaccount_metadata_totalCount	int64		☐	
freightSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
freightSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
freightSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
freightSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
freightSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
freightSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
freightSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
gln	varchar2	GLN	☐	Delivery settings tab > Default location settings section > GLN > The Global Location Number, associated w ith the location.
internalId	int32	Internal ID	☐	
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
invoiceAddress_county_id	varchar2	Invoice Address County ID	☐	Click the magnifier > The identifier
invoiceAddress_county_name	varchar2	Invoice Address County Name	☐	Click the magnifier > The displayed name
invoiceAddress_postalCode	varchar2	Invoice Address Postal Code	☐	Postcode > The postcode.
invoiceContact_attention	varchar2	Invoice Contact Attention	☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
invoiceContact_contactId	int32	Invoice Contact ID	☐	
invoiceContact_email	varchar2	Invoice Contact Email Address	☐	Email > The email address of the customer/supplier/company as a business entity.
invoiceContact_fax	varchar2	Invoice Contact Fax	☐	Fax > The fax number.
invoiceContact_name	varchar2	Invoice Contact Name	☐	Name > The legal name of to appear on the documents.
invoiceContact_phone1	varchar2	Invoice Contact Phone 1	☐	Phone 1 > The default phone number.
invoiceContact_phone2	varchar2	Invoice Contact Phone 2	☐	Phone 2 > An additional phone number.
invoiceContact_w eb	varchar2	Invoice Contact Website	☐	Web > The w ebsite of the company, if one exists.
invoiceOrdersSeparately	char		☐	The Billing settings tab > Order consolidation section > Invoice orders separately > Indicates w hether the customer should be invoiced separately.
invoiceToDefaultLocation	char	Invoice to Default Location	☐	Delivery settings tab > Default location settings > Invoice to default location > A check box indicating that the default location is to be used.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	Information collected from the system. Not visible on the screen.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
mainAddress_addressId	int32	Main Address ID	☐	
mainAddress_addressLine1	varchar2	Main Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.

vatZone_metadata_totalCount	int64		☐	

CustomerGlAccountSalesSubAccountSegmentsByInternalId: Visma.net Financials Customer GL Account Sales Sub Account Segments by Internal ID

Get a specific customer by internalIDData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer GL Account Sales Sub Account Segments by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerGlAccountSalesSubAccountSegmentsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the customer

Columns of Table Function

The columns of the table function CustomerGlAccountSalesSubAccountSegmentsByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and w ant to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.
active	char	Active	☐	Active > The status of the identifier.
cashDiscountAccount_description	varchar2		☐	Name of item/description
cashDiscountAccount_number	varchar2		☐	Number of item
cashDiscountAccount_type	varchar2		☐	
cashDiscountSubaccount_active	char		☐	Active > The status of the identifier.
cashDiscountSubaccount_description	varchar2		☐	Description > The description of the identifier.
cashDiscountSubaccount_errorInfo	varchar2		☐	
cashDiscountSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
cashDiscountSubaccount_metadata_maxPageSize	int64		☐	
cashDiscountSubaccount_metadata_totalCount	int64		☐	
cashDiscountSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
cashDiscountSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
cashDiscountSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
cashDiscountSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
cashDiscountSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
cashDiscountSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated w ith the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by w hich the customer payment may exceed the invoice date.

CustomerInvoiceApplicationsByCustomerNumber: Visma.net Financials Customer Invoice Applications by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoice Applications by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceApplicationsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or

voided	char		☐	

CustomerInvoiceAttachmentsForCustomerByCustomerNumber: Visma.net Financials Customer Invoice Attachments by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoice Attachments by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceAttachmentsForCustomerByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDueDate		☐		The date w hen payment for the document is due, in accordance w ith the credit terms.
documentDueDateCondition		☐		This value represents the condition to be applied to the Due

Name	Data Type	Label	Required	Documentation
				Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerInvoiceLinesAttachmentsByCustomerNumber: Visma.net Financials Customer Invoice Lines Attachments by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoice Lines Attachments by Customer Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceLinesAttachmentsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external

Name	Data Type	Label	Required	Documentation
				a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		☐	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It shows the identifier of the deferral schedule associated with the original Cash sale document.
description	varchar2	Description	☐	Transaction descr. > Any brief comment relevant to the transaction.The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, which the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
directDebitMandate_id	guid		☐	Mandate Guid as stored in the database.
directDebitMandate_mandateDescription	varchar2		☐	Mandate description show on Billing Address tab
directDebitMandate_mandateId	varchar2		☐	The id shown on Billing Address tab
discountAmount	double		☐	Discount amount > The amount of the line-level discount that has been applied manually orautomatically to this line.The system selects the Manual Discount check boxand calculates the line amount after you have entered the discount amountmanually and save your changes or added a new line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	varchar2	Discount Code	☐	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	☐	Discount percent > The percent of the line-level discount that has been applied manually orautomatically.The system selects the Manual Discount

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				check box andcalculates the discount amount after you have entered the percent manually andsaved your changes or added a new line.
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date when the customer ledger document was created.By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	☐	Mandatory field: The top part > Due date* > The date when payment for the document is due, in accordance with the credit terms.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
dunningLetterDate	datetime	Dunning Letter Date	☐	The Financial details tab > The dunning info section > Dunning letter date > The date of the last released dunning letter in which the document was listed.
dunningLetterLevel	int32	Dunning Letter Level	☐	The Financial details tab > The dunning info section > Dunning level > The dunning level of the document.
endDate_2	datetime		☐	
endDate	datetime	End Date	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
excludeDebtCollection	char		☐	Exclude Debt Collection for Autocollect
externalLink	varchar2		☐	
externalReference	varchar2	External Reference	☐	The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	varchar2	Financial Period	☐	The financial period to which the transactions recorded in the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				document should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document w ith the On Hold status may be edited and cannot be released.
id	guid	ID	☐	The ID of the attachment
inventoryNumber	varchar2	Inventory Number	☐	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	varchar2	Invoice Address County ID	☐	Click the magnifier > The identifier
invoiceAddress_county_name	varchar2	Invoice Address County Name	☐	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	char		☐	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	varchar2	Invoice Address Postal Code	☐	Postcode > The postcode.
invoiceContact_attention	varchar2	Invoice Contact Attention	☐	
invoiceContact_businessName	varchar2		☐	
invoiceContact_contactId	int32	Invoice Contact ID	☐	
invoiceContact_email	varchar2	Invoice Contact Email Address	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation

Name	Data Type	Label	Required	Documentation
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerInvoiceLineSubaccountSegmentsByCustomerNumber: Visma.net Financials Customer Invoice Line Subaccount Segments by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoice Line Subaccount Segments by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceLineSubaccountSegmentsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:*

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				``yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDueDate		☐		The date w hen payment for the document is due, in accordance w ith the credit terms.
documentDueDateCondition		☐		This value represents the condition to be applied to the Due Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than

Name	Data Type	Label	Required	Documentation
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	Mandatory field: The top part > Cash discount date * > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
childRecord_name	varchar2		☐	Click the magnifier. > The name.
childRecord_number	varchar2		☐	Click the magnifier. > The identifier.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_id	int32	Contact ID	☐	Click the magnifier > The identifier
contact_name	varchar2	Contact Name	☐	Click the magnifier > The displayed name
contractDocRef	varchar2		☐	
cost	double	Cost	☐	Cost > The total cost of the line in default currency. The value will always be 0 for unreleased documents.
createdDateTime	datetime	Created	☐	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency of the document. By default, it is the customer's default currency,but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.
customerVatZone_description	varchar2	VAT Zone Description	☐	Click on the magnifier. > The description.
customerVatZone_id	varchar2	VAT Zone ID	☐	Click on the magnifier. > The identifier.
debtCollection_caseNumber	varchar2		☐	Debt Collection Case Number
debtCollection_caseStatus	varchar2		☐	Debt Collection Case Number
debtCollection_caseType	varchar2		☐	Debt Collection Case Number
debtCollection_caseUrl	varchar2		☐	Debt Collection Case Number
deductableAmount	double		☐	
deferralCode	varchar2		☐	The deferral code assigned to the stock item or non-stock item specified in thisdocument line.Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		☐	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It show s the identifier of the deferral schedule associated w ith the original Cash sale document.
description_2	varchar2	Description 2	☐	Transaction descr. > Any brief comment relevant to the transaction.The alphanumeric string may contain up to 30 characters.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, w hich the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
directDebitMandate_id	guid		☐	Mandate Guid as stored in the database.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
directDebitMandate_mandateDescription	varchar2		☐	Mandate description show on Billing Address tab
directDebitMandate_mandateId	varchar2		☐	The id show n on Billing Address tab
discountAmount	double		☐	Discount amount > The amount of the line-level discount that has been applied manually orautomatically to this line.The system selects the Manual Discount check boxand calculates the line amount after you have entered the discount amountmanually and save your changes or added a new line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	varchar2	Discount Code	☐	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	☐	Discount percent > The percent of the line-level discount that has been applied manually orautomatically.The system selects the Manual Discount check box andcalculates the discount amount after you have entered the percent manually andsaved your changes or added a new line.
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date w hen the customer ledger document w as created.By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	☐	Mandatory field: The top part > Due date* > The date w hen payment for the document is due, in accordance w ith the credit terms.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The follow ing types are available: invoice, debit note, credit note, overdue charge, credit w rite-off

				manually if the deferral code assigned to the item is based on the Flexible by periods, prorate by days or Flexible by days in period recognition method.This column only appears if the Deferred revenue management functionality is enabled in the(CS100000) w indow .
termStartDate	datetime	Term Start Date	☐	Term start date > The date w hen the process of deferred revenue recognition should start for the selected item; this date can be specified manually if the deferral code assigned to the item is based on the Flexible by periods, prorate by days or Flexible by days in period recognition method.This column only appears if the Deferred revenue management functionality is enabled in the(CS100000) w indow .
timeStamp_2	blob		☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.
typeOfWork_description	varchar2		☐	
typeOfWork_rutRotType	varchar2		☐	
typeOfWork_xmlTag	varchar2		☐	
unitPrice	double		☐	Unit price > The unit price set for the item or service. If you w ant to update the unit priceautomatically to the current value(that is, the applicable sales or default price),you can use the Recalculate Prices and Discounts action.If you have modifiedthe unit price and saved the document, the value w ill not be updated by thesystem if you change the document date.
unitPriceInCurrency	double	Unit Price in Currency	☐	Background calculation giving you the Unit price in your default currency. This field is applicable if the amount is given in another currency than your default.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure (UoM) for the item.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerInvoicesForCustomerByCustomerNumber: Visma.net Financials Customer Invoices by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoices by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function CustomerInvoicesForCustomerByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-

Columns of Table Function

The columns of the table function CustomerInvoicesForCustomerByCustomerNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
accountingCostRef	varchar2		☐	
amount	double	Amount	☐	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 w indow .If the check box is cleared, then the value appears w hen the document status is Open.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount w as taken. For a document used in the application process, this is the balance after the payments w ere applied.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				that has been or will be taken on the document, which the system calculates based on the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	Mandatory field: The top part > Cash discount date * > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
childRecord_name	varchar2		☐	Click the magnifier. > The name.
childRecord_number	varchar2		☐	Click the magnifier. > The identifier.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_id	int32	Contact ID	☐	Click the magnifier > The identifier
contact_name	varchar2	Contact Name	☐	Click the magnifier > The displayed name
contractDocRef	varchar2		☐	
createdDateTime	datetime	Created	☐	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency of the document. By default, it is the customer's default currency,but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customerVatZone_description	varchar2	VAT Zone Description	☐	Click on the magnifier. > The description.
customerVatZone_id	varchar2	VAT Zone ID	☐	Click on the magnifier. > The identifier.
debtCollection_caseNumber	varchar2		☐	Debt Collection Case Number
debtCollection_caseStatus	varchar2		☐	Debt Collection Case Number
debtCollection_caseType	varchar2		☐	Debt Collection Case Number
debtCollection_caseUrl	varchar2		☐	Debt Collection Case Number
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, which the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
directDebitMandate_id	guid		☐	Mandate Guid as stored in the database.
directDebitMandate_mandateDescription	varchar2		☐	Mandate description show on Billing Address tab
directDebitMandate_mandateId	varchar2		☐	The id shown on Billing Address tab
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date when the customer ledger document was created.By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	☐	Mandatory field: The top part > Due date* > The date when payment for the document is due, in accordance with the credit terms.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The following types are available: invoice, debit note, credit note, overdue charge, credit write-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
dunningLetterDate	datetime	Dunning Letter Date	☐	The Financial details tab > The dunning info section > Dunning letter date > The date

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				of the last released dunning letter in w hich the document w as listed.
dunningLetterLevel	int32	Dunning Letter Level	☐	The Financial details tab > The dunning info section > Dunning level > The dunning level of the document.
endDate	datetime	End Date	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
excludeDebtCollection	char		☐	Exclude Debt Collection for Autocollect
externalReference	varchar2	External Reference	☐	The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document w ith the On Hold status may be edited and cannot be released.
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	varchar2	Invoice Address County ID	☐	Click the magnifier > The identifier
invoiceAddress_county_name	varchar2	Invoice Address County Name	☐	Click the magnifier > The displayed name

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
invoiceAddress_overrideAddress	char		☐	Override address > A check box that indicates (if selected) that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	varchar2	Invoice Address Postal Code	☐	Postcode > The postcode.
invoiceContact_attention	varchar2	Invoice Contact Attention	☐	
invoiceContact_businessName	varchar2		☐	
invoiceContact_contactId	int32	Invoice Contact ID	☐	
invoiceContact_email	varchar2	Invoice Contact Email Address	☐	
invoiceContact_overrideContact	char		☐	
invoiceContact_phone1	varchar2	Invoice Contact Phone 1	☐	
invoiceText	varchar2	Invoice Text	☐	The top part > Invoice text > Any user-provided description of the customer ledger document.
isRotRutDeductible	char		☐	The top part > Domestic services deductible document > A check box indicating if the document is Rot/rut deductible (applicable for the Swedish markets)
lastModifiedDateTime	datetime	Last Modified	☐	System generated field for last modification date/time of document.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note	varchar2	Note	☐	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the document.
originatorDocRef	varchar2		☐	
origInvoiceDate	datetime	Original Invoice Date	☐	The top part > Orig invoice date > The date based on which the Due date and Cash discount date is calculated. Only used if setting "Use Orig Invoice Date" is active in AR Preferences.By default, for a new document, it is the current business date, but you can change the date.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentReference	varchar2	Payment Reference	☐	///The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance w ith the number series assigned to cash sales in the Customer ledger preferences w indow ..
postPeriod	varchar2	Post Period	☐	The top part > Post period > The period to w hich the document should be posted. Format YYYYMM.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
referenceNumber	varchar2	Reference Number	☐	The Top part > Ref. no. > The reference number of the customer ledger document in the system.
revoked	char	Revoke	☐	
roundingDiff	double	Rounding Difference	☐	The top part > Rounding diff. > The difference betw een the original amount and the rounded amount.
salesPerson_description	varchar2	Sales Person Description	☐	Click on the magnifier. > The description.
salesPerson_id	varchar2	Sales Person ID	☐	Click on the magnifier. > The identifier.
salesPersonDescr	varchar2	Sales Person Name	☐	The field is deprecated for customer document endpoints, please use SalesPerson instead
salesPersonID	int32	Sales Person ID	☐	The field is deprecated for customer document endpoints, please use SalesPerson instead
sendToAutoInvoice	char	Send to Auto-invoice	☐	The Attachment tab > Send the file to AutoInvoice > The selected files w ill be attached to the invoice.
startDate	datetime	Start Date	☐	
status	varchar2	Status	☐	The top part > Status > The status of the document, w hich can be one of the follow ing: Hold, Balanced, Voided, Scheduled, Open, Closed, Pending print, Pending email.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.

project		☐		The project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document. Use the dropdow n to select status. (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, PendingPrint, PendingEmail, CreditHold, CcHold, Reserved)

Columns of Table Function

The columns of the table function CustomerInvoicesLinesForCustomerByCustomerNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active_2	char	Account Active 2	☐	
account_active	char	Account Active	☐	
account_description_2	varchar2	Account Description 2	☐	Name of item/description
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1_2	varchar2	Account External Code 1 2	☐	Account class > The identifier of the account class.
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2_2	varchar2	Account External Code 2 2	☐	Account class > The name of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number_2	varchar2	Account Number 2	☐	Number of item
account_number	varchar2	Account Number	☐	Number of item
account_type_2	varchar2	Account Type 2	☐	Account > The account number.
account_type	varchar2	Account Type	☐	Account > The account number.
accountingCostRef	varchar2		☐	
amount_2	double		☐	The top part > Amount > The amount paid by the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 w indow .If the check box is cleared, then the value appears w hen the document status is Open.
amount	double	Amount	☐	Amount > The amount after the discount has been applied. The value of this read-only boxis calculated automatically by deducting the discount amount from the extended price.
amountInCurrency_2	double	Amount in Currency 2	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in a another currency than your default.
amountInCurrency	double	Amount in Currency	☐	Background calculation giving you the Amount in your default currency. This field is applicable if the amount is given in another currency than your default.
balance	double	Balance	☐	The top part > Balance > For an open customer ledger document, the balance after any cash discount w as taken. For a document used in the application process, this is the balance after the payments w ere applied.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in a another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The top part > Cash discount > The cash discount amount that has been or w ill be taken on the document, w hich the system calculates based on the specified credit terms.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountDate	datetime	Cash Discount Date	☐	Mandatory field: The top part > Cash discount date * > The end date of the cash discount period, which the system calculates by using the credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
childRecord_name	varchar2		☐	Click the magnifier. > The name.
childRecord_number	varchar2		☐	Click the magnifier. > The identifier.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_id	int32	Contact ID	☐	Click the magnifier > The identifier
contact_name	varchar2	Contact Name	☐	Click the magnifier > The displayed name
contractDocRef	varchar2		☐	
cost	double	Cost	☐	Cost > The total cost of the line in default currency. The value will always be 0 for unreleased documents.
createdDateTime	datetime	Created	☐	The Attachments tab > Creation time > The date the attachment was created.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency of the document. By default, it is the customer's default currency,but it can be changed if the Allow Currency Override check box is selected in the AR303000 window.
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerProject	varchar2	Customer Project	☐	The top part > Customer project no. > The customer project no. used in AutoInvoice.
customerRefNumber	varchar2	Custom Reference Number	☐	The top part > External reference > The external reference used in AutoInvoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customerVatZone_description	varchar2	VAT Zone Description	☐	Click on the magnifier. > The description.
customerVatZone_id	varchar2	VAT Zone ID	☐	Click on the magnifier. > The identifier.
debtCollection_caseNumber	varchar2		☐	Debt Collection Case Number
debtCollection_caseStatus	varchar2		☐	Debt Collection Case Number
debtCollection_caseType	varchar2		☐	Debt Collection Case Number
debtCollection_caseUrl	varchar2		☐	Debt Collection Case Number
deductableAmount	double		☐	
deferralCode	varchar2		☐	The deferral code assigned to the stock item or non-stock item specified in thisdocument line.Upon release of the document, the system generates a deferralschedule (or schedules) based on the settings defined in this deferral code.
deferralSchedule	int32		☐	Original deferral schedule > A read-only column filled in by the system in the Cash return documents created by the reversing process. It show s the identifier of the deferral schedule associated w ith the original Cash sale document.
description	varchar2	Description	☐	Transaction descr. > Any brief comment relevant to the transaction.The alphanumeric string may contain up to 30 characters.
detailTotal	double	Detail Total	☐	The top part > Detail total > The document total, w hich the system calculates for all line items in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in a another currency than your default.
directDebitMandate_id	guid		☐	Mandate Guid as stored in the database.
directDebitMandate_mandateDescription	varchar2		☐	Mandate description show on Billing Address tab
directDebitMandate_mandateId	varchar2		☐	The id show n on Billing Address tab
discountAmount	double		☐	Discount amount > The amount of the line-level discount that has been applied manually orautomatically to this line.The system selects the Manual Discount check boxand calculates the line amount after you have entered the discount

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				amountmanually and save your changes or added a new line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in your default currency. This field is applicable if the amount is given in another currency than your default.
discountCode	varchar2	Discount Code	☐	The code of the line discount that has been applied to this line automatically or manually.
discountPercent	double	Discount Percent	☐	Discount percent > The percent of the line-level discount that has been applied manually orautomatically.The system selects the Manual Discount check box andcalculates the discount amount after you have entered the percent manually andsaved your changes or added a new line.
discountTotal	double	Discount Total	☐	The top part > Discount total > The document discount total.
discountTotalInCurrency	double	Discount Total in Currency	☐	The top part > Discount total > The document discount total in your default currency. This field is applicable if the amount is given in a another currency than your default.
documentDate	datetime	Document Date	☐	The top part > Date* > The date w hen the customer ledger document w as created.By default, for a new document, it is the current business date, but you can change the date.
documentDueDate	datetime	Document Due Date	☐	Mandatory field: The top part > Due date* > The date w hen payment for the document is due, in accordance w ith the credit terms.
documentType	varchar2	Document Type	☐	The top part > Type > The document type. The follow ing types are available: invoice, debit note, credit note, overdue charge, credit w rite-off
dontEmail	char	Don't Email	☐	
dontPrint	char	Don't Print	☐	
dunningLetterDate	datetime	Dunning Letter Date	☐	The Financial details tab > The dunning info section > Dunning letter date > The date of the last released dunning letter in w hich the document w as listed.
dunningLetterLevel	int32	Dunning Letter Level	☐	The Financial details tab > The dunning info section > Dunning level > The dunning level of the document.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
endDate_2	datetime		☐	
endDate	datetime	End Date	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
excludeDebtCollection	char		☐	Exclude Debt Collection for Autocollect
externalLink	varchar2		☐	
externalReference	varchar2	External Reference	☐	The top part > External reference > The external reference used in AutoInvoice.
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft. A document w ith the On Hold status may be edited and cannot be released.
inventoryNumber	varchar2	Inventory Number	☐	Item ID > The item ID of the line item, if applicable. Only a non-stock item can be selected.
invoiceAddress_addressId	int32	Invoice Address ID	☐	
invoiceAddress_addressLine1	varchar2	Invoice Address Line 1	☐	Address 1 > The first line of the customer's contact address.
invoiceAddress_addressLine2	varchar2	Invoice Address Line 2	☐	Address 2 > The second line of the address.
invoiceAddress_addressLine3	varchar2	Invoice Address Line 3	☐	Address 3 > The third line of the address.
invoiceAddress_city	varchar2	Invoice Address City	☐	City > The city.
invoiceAddress_country_errorInfo	varchar2	Invoice Address Country Error Information	☐	
invoiceAddress_country_id	varchar2	Invoice Address Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
invoiceAddress_country_metadata_maxPageSize	int64		☐	
invoiceAddress_country_metadata_totalCount	int64		☐	
invoiceAddress_country_name	varchar2	Invoice Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
invoiceAddress_county_id	varchar2	Invoice Address County ID	☐	Click the magnifier > The identifier
invoiceAddress_county_name	varchar2	Invoice Address County Name	☐	Click the magnifier > The displayed name
invoiceAddress_overrideAddress	char		☐	Override address > A check box that indicates (if selected)

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				that the invoice address is not the default invoice address of the customer.
invoiceAddress_postalCode	varchar2	Invoice Address Postal Code	☐	Postcode > The postcode.
invoiceContact_attention	varchar2	Invoice Contact Attention	☐	
invoiceContact_businessName	varchar2		☐	
invoiceContact_contactId	int32	Invoice Contact ID	☐	
invoiceContact_email	varchar2	Invoice Contact Email Address	☐	
invoiceContact_overrideContact	char		☐	
invoiceContact_phone1	varchar2	Invoice Contact Phone 1	☐	
invoiceText	varchar2	Invoice Text	☐	The top part > Invoice text > Any user-provided description of the customer ledger document.
isRotRutDeductible_2	char	Is ROTRUT Deductible 2	☐	The top part > Domestic services deductible document > A check box indicating if the document is Rot/rut deductible (applicable for the Swedish markets)
isRotRutDeductible	char		☐	
itemType	varchar2	Item Type	☐	
lastModifiedDateTime	datetime	Last Modified	☐	System generated field for last modification date/time of document.
lineNumber	int32	Line Number	☐	Line no. > A counter of lines in the overview of cash sales document overview .
lineType	varchar2	Line Type	☐	Transaction line type.Possible Values:-> Inventory = "GI";-> NonInventory = "GN";-> MiscCharge = "MI";-> Freight = "FR";-> Discount = "DS";-> Reallocation = "RA";
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualAmount	double	Manual Amount	☐	Manual amount > a check box indicating that the amount has been entered manually.
manualAmountInCurrency	double		☐	Background calculation giving you the Manual amount in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
manualDiscount	char	Manual Discount	☐	Manual discount > A check box that indicates (if selected) that the discount has been appliedmanually.If you clear the check box, the system clears entered discount percent,or discount amount, or selected discount code.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	Icon Notes on top of the w indow > Pop-up w indow for providing any user-defined text connected to the document.
note	varchar2	Note	☐	Table > Icon Notes > Pop-up w indow for providing any user-defined text connected to the order.
originatorDocRef	varchar2		☐	
origInvoiceDate	datetime	Original Invoice Date	☐	The top part > Orig invoice date > The date based on w hich the Due date and Cash discount date is calculated. Only used if setting "Use Orig Invoice Date" is active in AR Preferences.By default, for a new document, it is the current business date, but you can change the date.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentReference	varchar2	Payment Reference	☐	///The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance w ith the number series assigned to cash sales in the Customer ledger preferences w indow ..
postPeriod	varchar2	Post Period	☐	The top part > Post period > The period to w hich the document should be posted. Format YYYYMM.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	Quantity > The quantity of items (goods or services) of a particular type sold to the customer.
referenceNumber	varchar2	Reference Number	☐	The Top part > Ref. no. > The reference number of the customer ledger document in the system.
revoked	char	Revoke	☐	
roundingDiff	double	Rounding Difference	☐	The top part > Rounding diff. > The difference between the original amount and the rounded amount.
salesPerson_2_description	varchar2	Salesperson 2 Description	☐	Click on the magnifier. > The description.
salesPerson_2_id	varchar2	Salesperson 2 ID	☐	Click on the magnifier. > The identifier.
salesperson	varchar2	Salesperson	☐	The field is deprecated for customer document endpoints, please use Seller instead
salesPersonDescr	varchar2	Sales Person Name	☐	The field is deprecated for customer document endpoints, please use SalesPerson instead
salesPersonID	int32	Sales Person ID	☐	The field is deprecated for customer document endpoints, please use SalesPerson instead
seller_description	varchar2	Seller Description	☐	Click on the magnifier. > The description.
seller_id	varchar2	Seller ID	☐	Click on the magnifier. > The identifier.
sendToAutoInvoice	char	Send to Auto-invoice	☐	The Attachment tab > Send the file to AutoInvoice > The selected files will be attached to the invoice.
soOrderNbr	varchar2		☐	
soOrderType	varchar2		☐	
soShipmentNbr	varchar2		☐	
startDate_2	datetime		☐	
startDate	datetime	Start Date	☐	
status	varchar2	Status	☐	The top part > Status > The status of the document, which can be one of the following: Hold, Balanced, Voided, Scheduled, Open, Closed, Pending print, Pending email.
subaccount_active_2	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description_2	varchar2	Sub Account Description 2	☐	Description > The description of the identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo_2	varchar2	Sub Account Error Information 2	☐	
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime_2	datetime	Sub Account Last Modified Date/Time 2	☐	System generated information.
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize_2	int64	Sub Account Metadata Max Pagesize 2	☐	
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount_2	int64	Sub Account Metadata Total Count 2	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId_2	int32	Sub Account ID 2	☐	SubID > The identifier of the subaccount.
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber_2	varchar2	Sub Account Number 2	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp_2	blob		☐	The timestamp of the subaccount, used for concurrency control.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
termEndDate	datetime	Term End Date	☐	Term end date > The date when the process of the deferred revenue recognition should finish for the selected item; this date can be specified manually if the deferral code assigned to the item is based on the Flexible by periods, prorate by days or Flexible by days in period recognition method.This column only appears if the Deferred revenue management functionality is enabled in the(CS100000) window .
termStartDate	datetime	Term Start Date	☐	Term start date > The date when the process of deferred revenue recognition should start for the selected item; this date can be specified manually if the deferral code assigned to the item is based on the Flexible by

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				periods, prorate by days or Flexible by days in period recognition method.This column only appears if the Deferred revenue management functionality is enabled in the(CS100000) w indow .
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
typeOfWork_description	varchar2		☐	
typeOfWork_rutRotType	varchar2		☐	
typeOfWork_xmlTag	varchar2		☐	
unitPrice	double		☐	Unit price > The unit price set for the item or service. If you w ant to update the unit priceautomatically to the current value(that is, the applicable sales or default price),you can use the Recalculate Prices and Discounts action.If you have modifiedthe unit price and saved the document, the value w ill not be updated by thesystem if you change the document date.
unitPriceInCurrency	double	Unit Price in Currency	☐	Background calculation giving you the Unit price in your default currency. This field is applicable if the amount is given in another currency than your default.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure (UoM) for the item.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The top part > VAT exempt. total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the tax w ith the Include in VAT Exempt Total check box selected on the Taxes form.This box is available only if the VAT Reporting feature is enabled in your system.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt. total in your default currency. This field is applicable if the amount is given in a another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatTaxableTotal	double	VAT Taxable Total	☐	The top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in a another currency than your default.
vatTotal	double	VAT Total	☐	The top part > VAT total > The VAT amount of the document, as defined on the VAT details tab.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerInvoiceSubaccountSegmentsByCustomerNumber: Visma.net Financials Customer Invoice Subaccount Segments by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoice Subaccount Segments by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceSubaccountSegmentsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
customer		☐		Filter by Customer
customerNumber		☑		Identifies the customer for w hich to return data
customerRefNumber		☐		The top part > External reference > The external reference used in AutoInvoice.
documentDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.
documentDueDate		☐		The date w hen payment for the document is due, in accordance

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				with the credit terms.
documentDueDateCondition		☐		This value represents the condition to be applied to the Due Date when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal
documentType		☐		The field is deprecated for specific customer document endpoints. It will only be usable from customer document endpoint. (Values: Invoice, DebitNote, CreditNote, Payment, VoidPayment, Prepayment, Refund, FinCharge, SmallBalanceWo, SmallCreditWo, CashSale, CashReturn, Undefined, NoUpdate)
dunningLetterDateTime		☐		The date and time for when the document last released a dunning letter.
dunningLetterDateTimeCondition		☐		Set time/date as before (<), after (>), before and including (=<) OR after and including (=>) to filter on time frame.
dunningLevel		☐		The dunning level of the document.
expandApplications		☐		True if you want to see all dunning information regarding this document.
expandAttachments		☐		True if you want to see all attachments regarding this document.
expandDunningInformation		☐		
expandInvoiceAddress		☐		True if you want to see all information regarding the invoice address for this document.
expandTaxDetails		☐		True if you want to see all VAT details regarding this document.
externalReference		☐		The top part > External reference > The external reference used in AutoInvoice.
financialPeriod		☐		The financial period to which the transactions recorded in the document is posted. Format YYYYMM.
greaterThanValue		☐		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
paymentReference		☐		The top part > Payment ref. > The reference number of the document, as automatically generated by the system in accordance w ith the number series assigned to cash sales in the Customer ledger preferences w indow ..
project		☐		The project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document. Use the dropdow n to select status. (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, PendingPrint, PendingEmail, CreditHold, CcHold, Reserved)

Columns of Table Function

The columns of the table function CustomerInvoiceSubaccountSegmentsByCustomerNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
account_type	varchar2	Account Type	☐	Account > The account number.
accountingCostRef	varchar2		☐	
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The top part > Amount > The amount paid by the document. The value appears for new documents if the Validate document totals on entry check box is selected on the AR101000 w indow .If the check box is cleared, then the value appears w hen the document status is Open.

CustomerInvoiceTaxDetailsByCustomerNumber: Visma.net Financials Customer Invoice Tax Details by Customer Number

Get a range of invoices for a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Invoice Tax Details by Customer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerInvoiceTaxDetailsByCustomerNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
closedFinancialPeriod		☐		The date of the closing of the financial period.

vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in a another currency than your default.

CustomerNoteByCustomerCode: Visma.net Financials Customer Note by Customer Code

Get a specific customer's note

Catalog: VismaNet

Schema: Customer

Label: Customer Note by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerNoteByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

				application and imports the sales orders from it.
customerVATZone_defaultTaxCategory_description	varchar2	VAT Zone Default Tax Category Description	☐	Name of item/description
customerVATZone_defaultTaxCategory_number	varchar2	VAT Zone Default Tax Category Number	☐	Number of item
customerVATZone_defaultVatCategory	varchar2	VAT Zone Default VAT Category	☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_description	varchar2	VAT Zone Description	☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_errorInfo	varchar2		☐	
customerVATZone_id	varchar2	VAT Zone ID	☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_metadata_maxPageSize	int64		☐	
customerVATZone_metadata_totalCount	int64		☐	
date	datetime	Date	☐	Mandatory field: The top part > Date* > The date of the document.
description	varchar2	Description	☐	The top part > Description > A brief description of the document.
discountTotal	double	Discount Total	☐	
discountTotalInBaseCurrency	double		☐	
dueDate	datetime	Due Date	☐	Financial settings tab > Financial information section > Due date > The due date of the invoice according to the credit terms.
emailed	char	Emailed	☐	A check box indicating if the document is emailed
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
fobPoint_description	varchar2	FOB Point Description	☐	Click on the magnifier. > The description.
fobPoint_id	varchar2	FOB Point ID	☐	Click on the magnifier. > The identifier.
hold	char	Hold	☐	The top part > Hold > A check box that you select if the document is on hold and should not be processed further at this time.
insurance	char	Insurance	☐	Delivery settings tab > Shipping information section >

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				Insurance > A check box that you select to indicate that insurance is required for this order.
invoiceDate	datetime	Invoice Date	☐	Financial settings tab > Financial information section > Invoice date> The date of the invoice generated for the order.
invoiceNbr	varchar2	Invoice Number	☐	Financial settings tab > Financial information section > Invoice no.> The invoice number of the invoice generated for this order.
invoiceSeparately	char	Invoice Separately	☐	Financial settings tab > Financial information section > Invoice separately > A check box that indicating that this document is to be invoiced separately (if that is required).
isRotRutDeductible	char		☐	A check box indicating if the document is Rot/rut deductible (applicable for the Swedish markets)
lastModifiedDateTime	datetime	Last Modified	☐	Background information collected from the system.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note	varchar2	Note	☐	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the order.
orderNo	varchar2	Order Number	☐	The top part > Order no.: > The reference number of the document.
orderTotal	double	Order Total	☐	The top part > Order total > The total amount of the document, which is calculated as follows:Line Total + Misc.Charges + Freight + Premium Freight – Discount Total+ Tax Total
orderTotalInBaseCurrency	double		☐	
orderType	varchar2	Order Type	☐	Mandatory field: The top part > Order type > The type of the document, which is one of the predefined order types or a custom order type created by using the (SO201000) window.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
origOrderNbr	varchar2	Original Order Number	☐	The top part > Order no. > The order number of the document.
origOrderType	varchar2	Original Order Type	☐	Mandatory field: The top part > Order type* > The type of the document, which is one of the predefined order types or a custom order type created by using the window SO201000.
owner_employeeId	varchar2	Owner Employee ID	☐	The Financial settings tab > The Financial information section > Owner > Click the magnifier > Employee ID > The unique identifier, which is assigned to the employee in accordance with the configuration of the EMPLOYEEsegmented key. This information is retrieved from window EP203000.
owner_id	guid	Owner ID	☐	Employee internal user ID. This is the ID of the user linked to the employee
owner_name	varchar2	Owner Name	☐	The Financial settings tab > The Financial information section > Owner > Click the magnifier > Employee name > The name of this employee. This information is retrieved from window EP203000.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRef	varchar2	Payment Reference	☐	Payment settings tab > Payment ref.
postPeriod	varchar2	Post Period	☐	The Financial settings tab > Financial information section > Post period > The period to post the transactions generated by the invoice. Format MMYYYY.
preferredWarehouse_description	varchar2	Preferred Warehouse Description	☐	Click on the magnifier. > The description.
preferredWarehouse_id	varchar2	Preferred Warehouse ID	☐	Click on the magnifier. > The identifier.
printDescriptionOnInvoice	char	Print Description on Invoice	☐	The top part > Print description on invoice > A check box
printNoteOnExternalDocuments	char	Print Note on External Documents	☐	The top part > Print note on external sales documents > A check box
printNoteOnInternalDocuments	char	Print Note on Internal Documents	☐	The top part > Print line note on internal sales documents > A check box
priority	int32	Priority	☐	Delivery settings tab > Shipping information section > Priority > Field only for

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				informational purposes. The level of priority for processing order of this customer, as specified for the customer on the Shipping settings tab on the AR303000 w indow .
projectCD	varchar2	Project Code	☐	Mandatory field: The top part > Project* > The field consists of Project ID and Project description. Project ID: The identifier for the project w ith w hich this document is associated, or the code indicating that this document is not associated w ith any project; the non-project code is specified in the Project accounting preferences (PM101000) w indow .
requestOn	datetime	Request On	☐	Mandatory field: The top part > Requested on > The date w hen the customer w ants to receive the goods; this date provides the default values for the Requested on dates for order lines.
residentialDelivery	char	Residential Delivery	☐	Delivery settings tab > Shipping information section > Residential delivery > A check box that you select to indicate that the shipment should be delivered to a residential area.
salesPerson_description	varchar2	Sales Person Description	☐	Click on the magnifier. > The description.
salesPerson_id	varchar2	Sales Person ID	☐	Click on the magnifier. > The identifier.
saturdayDelivery	char	Saturday Delivery	☐	Delivery settings tab > Shipping information section > Saturday delivery > A check box that indicates that the order may be delivered on Saturday.
schedShipment	datetime	Scheduled Shipment	☐	Delivery settings tab > Shipping information section > Sched. shipment > The date w hen the ordered goods are scheduled to be shipped.
shipComplete	varchar2	Ship Complete	☐	Delivery settings tab > Shipping information section > Shipping rule > An option that controls w hether incomplete and partial shipments for the order are allow ed.
shippingTerms_description	varchar2	Shipping Terms Description	☐	Click on the magnifier. > The description.
shippingTerms_id	varchar2	Shipping Terms ID	☐	Click on the magnifier. > The identifier.

CustomerOrderLineAttachmentsByCustomerCode: Visma.net Financials Customer Order Line Attachments by Customer Code

Get a range of SO Orders of a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Order Line Attachments by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOrderLineAttachmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

The columns of the table function CustomerOrderLineAttachmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID used by the customer.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date when the order should be cancelled if the Back order allowed option has been selected in the Shipping rule field.
canceled	char	Canceled	☐	The Delivery settings tab > The Shipping information section > Cancelled > A check box that indicates that the order has been cancelled on the date specified in Cancel by.
cashAccount	varchar2	Cash Account	☐	Payment settings tab > Cash account
cashDiscountDate	datetime	Cash Discount Date	☐	Financial settings tab > Financial information section >

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				Cash discount date > The date w hen the cash discount is available for the invoice based on the credit terms.
commissionable	char	Commissionable	☐	VAT code > The VAT category of the goods mentioned in this line.
commissionableAmount	varchar2		☐	The Commissions tab > Commissionable amount> The amount used to calculate the commission.
commissionAmount	varchar2	Commission Amount	☐	The Commissions tab > Commission amt. >The commission amount earned by the salesperson on this document.
commissionPercent	varchar2	Commission Percentage	☐	The Commissions tab > Commission (%) > The percentage of commission generally earned by the salesperson.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
completed	char	Completed	☐	Completed > A check box that can be selected to indicate to the system that this line is completed.
contactId	int32	Contact ID	☐	The top part > Contact > The contact person of the customer.
currency	varchar2	Currency	☐	The top part > Currency > The currency of the document.
customer_internalId	int32	Customer Internal ID	☐	
customer_name	varchar2	Customer Name	☐	The name of the particular destination of the selected type.
customer_number	varchar2	Customer Number	☐	The identifier of the particular destination of the selected type.
customerOrder	varchar2	Customer Order	☐	The top part > Customer order > The reference number of the original customer document that the sales order is based on.
customerRefNo	varchar2	Customer Reference Number	☐	The top part > External reference > The reference number of the sales order in a third-party application if Visma.net Financials is integrated w ith such an application and imports the sales orders from it.
customerVATZone_defaultTaxCategory_description	varchar2	VAT Zone Default Tax Category Description	☐	Name of item/description
customerVATZone_defaultTaxCategory_number	varchar2	VAT Zone Default Tax Category Number	☐	Number of item

CustomerOrderLinesByCustomerCode: Visma.net Financials Customer Order Lines by Customer Code

Get a range of SO Orders of a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Order Lines by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOrderLinesByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				__LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
orderType		☐		Filter by Order type.
showNotes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

The columns of the table function CustomerOrderLinesByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID used by the customer.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date when the order should be cancelled if the Back order allowed option has been selected in the Shipping rule field.
canceled	char	Canceled	☐	The Delivery settings tab > The Shipping information section > Cancelled > A check box that indicates that the order has been cancelled on the date specified in Cancel by.
cashAccount	varchar2	Cash Account	☐	Payment settings tab > Cash account
cashDiscountDate	datetime	Cash Discount Date	☐	Financial settings tab > Financial information section > Cash discount date > The date when the cash discount is

CustomerOrderShipmentsByCustomerCode: Visma.net Financials Customer Order Shipments by CustomerCode

Get a range of SO Orders of a specific customer

Catalog: VismaNet

Schema: Customer

Label: Customer Order Shipments by CustomerCode

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerOrderShipmentsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
orderType		☐		Filter by Order type.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

The columns of the table function CustomerOrderShipmentsByCustomerCode are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date w hen the order should be cancelled if the Back order allow ed option has been selected in the Shipping rule field.
canceled	char	Canceled	☐	The Delivery settings tab > The Shipping information section > Cancelled > A check box that indicates that the order has been cancelled on the date specified in Cancel by.
cashAccount	varchar2	Cash Account	☐	Payment settings tab > Cash account
cashDiscountDate	datetime	Cash Discount Date	☐	Financial settings tab > Financial information section > Cash discount date > The date w hen the cash discount is available for the invoice based on the credit terms.
commissionableAmount	varchar2		☐	The Commissions tab > Commissionable amount> The amount used to calculate the commission.
commissionAmount	varchar2	Commission Amount	☐	The Commissions tab > Commission amt. >The commission amount earned by the salesperson on this document.
commissionPercent	varchar2	Commission Percentage	☐	The Commissions tab > Commission (%) > The percentage of commission generally earned by the salesperson.

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/customer?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/customer?attributes={"AttributeID":"ValueID1,ValueID2"}
corporateId		☐		Equals Corporate ID from Delivery settings tab.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:__ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:__ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
email		☐		Equals Email for customer.
expandAccountInformation		☐		
expandDirectDebit		☐		Expand direct debit info
expandPaymentMethods		☐		

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		This field does not work and has been deprecated. It will be removed in future versions.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
name		☐		Contains Customer name.
phone		☐		Equals Phone 1 for customer.
status		☐		Drop down and select Status. (Values: Active, OnHold, CreditHold, Inactive, OneTime)
vatRegistrationId		☐		Equals VAT registration ID from Delivery settings tab.

Columns of Table Function

The columns of the table function CustomerPaymentMethods are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
acceptAutoInvoices	char	Accept Auto-invoices	☐	Invoicing settings > Print and email settings section > Send invoices to AutoInvoice > Select this check box if you are using AutoInvoice and want to send invoices directly to this service.
accountReference	varchar2	Account Reference	☐	General information tab > Main contact section > Account ref. > Your company's account number in the customer's system.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
corporateId	varchar2	Corporate ID	☐	Delivery settings tab > Default location settings section > Corporate ID > The customers company ID, associated w ith the location.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
creditDaysPastDue	int32	Credit Days Past Due	☐	General information tab > Credit verification rules section > Credit days past due > The maximum number of days by w hich the customer payment may exceed the invoice date.
creditLimit	double	Credit Limit	☐	The General information tab > Credit verification rules section > Credit limit > The amount, if applicable, that serves as a credit limit for the customer.
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
creditVerification	varchar2	Credit Verification	☐	The General information tab > Credit verification rules > Credit verification > The credit rule applied to this customer. The follow ing options are available: Days past due, Credit limit, Limit and days past due, disabled.
currencyId	varchar2	Currency ID	☐	The General information tab > Financial settings section > Currency ID > The currency used in operations w ith the customer, w hich you can select from the list of currencies defined in the system.
customerClass_description	varchar2	Customer Class Description	☐	Click on the magnifier. > The description.
customerClass_id	varchar2	Customer Class ID	☐	Click on the magnifier. > The identifier.
defaultPaymentMethodId	varchar2		☐	Invoicing settings tab > Default payment method section > The default payment method.
deliveryAddress_addressId	int32	Delivery Address ID	☐	
deliveryAddress_addressLine1	varchar2	Delivery Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
deliveryAddress_addressLine2	varchar2	Delivery Address Line 2	☐	Address 2 > The second line of the address.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deliveryAddress_addressLine3	varchar2	Delivery Address Line 3	☐	Address 3 > The third line of the address.
deliveryAddress_city	varchar2	Delivery Address City	☐	City > The city.
deliveryAddress_country_errorInfo	varchar2		☐	
deliveryAddress_country_id	varchar2	Delivery Address Country ID	☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
deliveryAddress_country_metadata_maxPageSize	int64		☐	
deliveryAddress_country_metadata_totalCount	int64		☐	
deliveryAddress_country_name	varchar2	Delivery Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
deliveryAddress_county_id	varchar2	Delivery Address County ID	☐	Click the magnifier > The identifier
deliveryAddress_county_name	varchar2	Delivery Address County Name	☐	Click the magnifier > The displayed name
deliveryAddress_postalCode	varchar2	Delivery Address Postal Code	☐	Postcode > The postcode.
deliveryContact_attention	varchar2	Delivery Contact Attention	☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
deliveryContact_contactId	int32	Delivery Contact ID	☐	
deliveryContact_email	varchar2	Delivery Contact Email Address	☐	Email > The email address of the customer/supplier/company as a business entity.
deliveryContact_fax	varchar2	Delivery Contact Fax	☐	Fax > The fax number.
deliveryContact_name	varchar2	Delivery Contact Name	☐	Name > The legal name of to appear on the documents.
deliveryContact_phone1	varchar2	Delivery Contact Phone 1	☐	Phone 1 > The default phone number.
deliveryContact_phone2	varchar2	Delivery Contact Phone 2	☐	Phone 2 > An additional phone number.
deliveryContact_web	varchar2	Delivery Contact Website	☐	Web > The website of the company, if one exists.
eInvoiceContract_fInvoiceContractID	varchar2		☐	
eInvoiceContract_fInvoiceIntermediatorID	varchar2		☐	
errorInfo	varchar2	Error Message	☐	
excludeDebtCollection	char		☐	Exclude Debt Collection for Autocollect

CustomerPaymentMethodsByCustomerCode: Visma.net Financials Customer Payment Methods by Customer Code

Get a specific customerData for the customer The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Customer

Label: Customer Payment Methods by Customer Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function CustomerPaymentMethodsByCustomerCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerCd		☑		Identifies the customer
