EmployeeExpenseReceiptsByEmployeeCode: Visma.net Financials Employee Expense Receipts by Employee Code

Get expense receipts for a specific employee

Catalog: VismaNet

Schema: Employee

Label: Employee Expense Receipts by Employee Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EmployeeExpenseReceiptsByEmployeeCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
claimedBy		☐		Identifies the employee from the document
customer		☐		Identifies the customer from the document
date		☐		The date of the document
dateCondition		☐		

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
employeeCd		☑		Identifies the employee
inventory		☐		Identifies the inventory item from the document
invoiceable		☐		If the document is invoiceable
project		☐		Identifies the project from the document
projectTask		☐		Filter on Task ID.
status		☐		The status of the document. (Values: Open, Pending, Approved, Rejected, Released)

Catalog: VismaNet

Schema: Employee

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EmployeeWorkGroupDescriptions. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
linkedToUser		☐		If the employee is linked to a user.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ExpenseClaims. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customer		☐		The customer from the document
date		☐		The date of the document
departmentId		☐		Identifies the department
greaterThanValue		☐		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ExpenseReceipts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
claimedBy		☐		Identifies the employee from the document
customer		☐		Identifies the customer from the document

				__LastModifiedDateTimeCondition__ are __mutually inclusive__.
status		☐		View all fixed assets with this Status. Available statuses are: Active, Disposed, FullyDepriciated, Hold, Reversed, Suspended. (Values: Active, Disposed, FullyDepreciated, Hold, Reversed, Suspended)
toDate		☐		To 'Placed in service date' inclusive. Date format: YYYY-MM-DD.

Columns of Table Function

The columns of the table function FixedAsset are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accounts_accountID	varchar2		☐	The fixed asset account for this fixed asset
accounts_accrualAccountID	varchar2		☐	The accrual account for this fixed asset
accounts_accrualSubAccountID	varchar2		☐	The accrual sub account for this fixed asset
accounts_accumulatedDepreciationAccountID	varchar2		☐	The accumulated depreciation account for this fixed asset
accounts_accumulatedDepreciationSubAccountID	varchar2		☐	The accumulated depreciation sub for this fixed asset
accounts_creditAccountID	varchar2		☐	The credit account
accounts_creditSubAccountID	varchar2		☐	The credit sub account
accounts_debitAccountID	varchar2		☐	The debit account
accounts_debitSubAccountID	varchar2		☐	The debit sub account
accounts_depreciatedExpenseAccountID	varchar2		☐	The depreciation expense account for this fixed asset
accounts_depreciatedExpenseSubAccountID	varchar2		☐	The depreciation expense sub for this fixed asset
accounts_disposalAccountID	varchar2		☐	The proceeds account for this fixed asset
accounts_disposalSubAccountID	varchar2		☐	The proceeds sub for this fixed asset
accounts_gainAccountID	varchar2		☐	The gain account for this fixed asset
accounts_gainSubAccountID	varchar2		☐	The gain sub for this fixed asset
accounts_lossAccountID	varchar2		☐	The loss account for this fixed asset
accounts_lossSubAccountID	varchar2		☐	The loss sub for this fixed asset
accounts_subAccountID	varchar2		☐	The sub account for this fixed asset

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
assetID	varchar2		☐	The id that identifies this fixed asset
bookBalance_acquisitionCost	double		☐	The acquisition cost of this fixed asset
bookBalance_book_bookID	varchar2		☐	The book id of this fixed asset
bookBalance_book_description	varchar2		☐	The description of the book
bookBalance_depreciationFromDate	datetime		☐	The date this asset is placed in service
bookBalance_depreciationFromPeriod	varchar2		☐	The first period this fixed asset will start/has started depreciating
bookBalance_depreciationMethodID	varchar2		☐	The depreciation method id of this fixed asset
bookBalance_depreciationToPeriod	varchar2		☐	The last period this fixed asset will depreciate/ was depreciated
bookBalance_lastDepreciationPeriod	varchar2		☐	The last period this asset has been depreciated
bookBalance_salvageAmount	double		☐	The salvage amount of this fixed asset
bookBalance_usefulLife	double		☐	The useful life of this fixed asset in years
classID	varchar2		☐	The class id of this fixed asset
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
depreciable	char		☐	Indicates if this fixed asset can be depreciated or not
description	varchar2	Description	☐	The description of this fixed asset
details_acquisitionCost	double		☐	The acquisition cost of this fixed asset
details_billNumber	varchar2		☐	The bill number of the fixed asset invoice
details_depreciateFromDate	datetime		☐	The date this asset is placed in service
details_disposalDate	datetime		☐	The date of the disposal of this fixed asset
details_disposalMethod_description	varchar2		☐	The description of the disposal method
details_disposalMethodID	int32		☐	The disposal method of this fixed asset
details_disposalPeriodID	varchar2		☐	The period of the disposal of this fixed asset
details_leaseAndRentInfo_leaseNumber	varchar2		☐	
details_leaseAndRentInfo_leaseRentTerm	int32		☐

FixedAssetById: Visma.net Financials Fixed Asset by ID

Get a specific Fixed Asset - Screen ID:FA303000

Catalog: VismaNet

Schema: FixedAsset

Label: Fixed Asset by ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function FixedAssetById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
ExpandAccounts		☐		Set to True to include accounts and subaccounts. Default value is False
FixedAssetID		☑		Identifies the fixed asset

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		A brief description of the stock item from the Top part of the w indow .
expandAccountInformation		☐		Set to true to retrieve information about the account information connected to the item.
expandAttachment		☐		Set to true to retrieve information about the attachments connected to the item.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
expandAttribute		☐		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference		☐		These expand fields are by default set to true, but w ill be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits		☐		Set to true to retrieve information about the units of measure connected to the item.
expandNote		☐		Set to true to retrieve the note value connected to the item.
expandSalesCategories		☐		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails		☐		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail		☐		Set to true to retrieve information about the w arehouse connected to the item.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
inventoryNumber		☐		The Item ID.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
salesCategory		☐		The Category ID for the sales category, found on the Attributes tab.

InventoryAttachmentsByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function InventoryAttachmentsByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryAttributes: Visma.net Financials Inventory Attributes

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Attributes

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAttributes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics		☐		This filter can be used only for stock items, from the Price/cost information tab.
alternateID		☐		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
attachmentLastModifiedDateTime		☐		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition		☐		System retrieved information for state/condition for attachment.
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}
availabilityLastModifiedDateTime		☐		System retrieved information.
availabilityLastModifiedDateTimeCondition		☐		System retrieved information for state/condition.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		A brief description of the stock item from the Top part of the w indow .
expandAccountInformation		☐		Set to true to retrieve information about the account information connected to the item.
expandAttachment		☐		Set to true to retrieve information about the attachments connected to the item.
expandAttribute		☐		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference		☐		These expand fields are by default set to true, but w ill be changed in the future. Set to true

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits		☐		Set to true to retrieve information about the units of measure connected to the item.
expandNote		☐		Set to true to retrieve the note value connected to the item.
expandSalesCategories		☐		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails		☐		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail		☐		Set to true to retrieve information about the w arehouse connected to the item.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
inventoryNumber		☐		The Item ID.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
salesCategory		☐		The Category ID for the sales category, found on the Attributes tab.
status		☐		The inventory item status (Values: Active, NoSales, NoPurchases, NoRequest, Inactive, MarkedForDeletion)

InventoryAttributesByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAttributesByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
inventoryId		☑		Identifies the Inventory item

InventoryAttributesByInventoryNumber: Visma.net Financials Inventory Attributes by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Schema: Inventory

Label: Inventory Attributes by Inventory Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAttributesByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryByNumber: Visma.net Financials Inventory by Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryCrossReferences: Visma.net Financials Inventory Cross-references

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Cross-references

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryCrossReferences. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics		☐		This filter can be used only for stock items, from the Price/cost information tab.
alternateID		☐		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime		☐		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition		☐		System retrieved information for state/condition for attachment.
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}
availabilityLastModifiedDateTime		☐		System retrieved information.
availabilityLastModifiedDateTimeCondition		☐		System retrieved information for state/condition.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:__ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:__ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		A brief description of the stock item from the Top part of the w indow .

InventoryCrossReferencesByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryCrossReferencesByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Get a range of cross-reference for a specific inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Cross-references by Inventory Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryCrossReferencesByInventoryNumber2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Columns of Table Function

The columns of the table function InventoryCrossReferencesByInventoryNumber2 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Mandatory field: Alternate ID > The alternate ID of the stock item (under the specified item ID) as used by the supplier or customer.
alternateType	varchar2	Alternate Type	☐	Alternate type > The type of alternate codification used for the item if applicable.
bAccount_internalId	int32		☐	
bAccount_name	varchar2		☐	The name of the particular destination of the selected type.
bAccount_number	varchar2		☐	The identifier of the particular destination of the selected type.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
description	varchar2	Description	☐	Description > Any comments applicable to the specified cross-reference.
isDefault	char	Is Default	☐	Default > Indicates whether this cross-reference is marked as the default one.
timestamp	varchar2	Timestamp	☐	Timestamp of the inventory item the crossreference belongs to
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure used for this component.

InventoryItemClassAttributeDetailsByInventoryNumber: Visma.net Financials Inventory Item Class Attribute Details by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Item Class Attribute Details by Inventory Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryItemClassAttributeDetailsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryItemClassAttributesByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryItemClassAttributesByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryPOReceiptTakeBarCodesByReceiptNumber: Visma.net Financials Inventory PO Receipt Take Barcodes by Receipt Number

Get a range of barcodes for a specific purchase receipt

Catalog: VismaNet

Schema: Inventory

Label: Inventory PO Receipt Take Barcodes by Receipt Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryPOReceiptTakeBarCodesByReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

InventorySalesCategoriesByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventorySalesCategoriesByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventorySalesCategoriesByInventoryNumber: Visma.net Financials Inventory Sales Categories by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Sales Categories by Inventory Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventorySalesCategoriesByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventorySalesOrderBarCodesByOrderNumber: Visma.net Financials Inentory Sales Order Barcodes by Order Number

Get a range of barcodes for a specific sales order

Catalog: VismaNet

Schema: Inventory

Label: Inentory Sales Order Barcodes by Order Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventorySalesOrderBarCodesByOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventorySupplierDetailsByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventorySupplierDetailsByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryUnitItemClassAttributeDetails

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitItemClassAttributeDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics		☐		This filter can be used only for stock items, from the Price/cost information tab.
alternateID		☐		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime		☐		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition		☐		System retrieved information for state/condition for attachment.
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}
availabilityLastModifiedDateTime		☐		System retrieved information.
availabilityLastModifiedDateTimeCondition		☐		System retrieved information for state/condition.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.

Name	Data Type	Required	Default Value	Documentation
description		☐		A brief description of the stock item from the Top part of the w indow .
expandAccountInformation		☐		Set to true to retrieve information about the account information connected to the item.
expandAttachment		☐		Set to true to retrieve information about the attachments connected to the item.
expandAttribute		☐		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference		☐		These expand fields are by default set to true, but w ill be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits		☐		Set to true to retrieve information about the units of measure connected to the item.
expandNote		☐		Set to true to retrieve the note value connected to the item.
expandSalesCategories		☐		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails		☐		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail		☐		Set to true to retrieve information about the w arehouse connected to the item.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
inventoryNumber		☐		The Item ID.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than*

InventoryUnitItemClassAttributeDetailsByinventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitItemClassAttributeDetailsByinventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryUnitItemClassAttributeDetailsByInventoryNumber

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitItemClassAttributeDetailsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
inventoryNumber		☑		Identifies the Inventory item

Name	Data Type	Required	Default Value	Documentation
				filter applies only for one of these.
attachmentLastModifiedDateTime		☐		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition		☐		System retrieved information for state/condition for attachment.
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}
availabilityLastModifiedDateTime		☐		System retrieved information.
availabilityLastModifiedDateTimeCondition		☐		System retrieved information for state/condition.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		A brief description of the stock item from the Top part of the w indow .
expandAccountInformation		☐		Set to true to retrieve information about the account information connected to the item.
expandAttachment		☐		Set to true to retrieve information about the attachments connected to the item.
expandAttribute		☐		Set to true to retrieve the attribute descriptions used for the item.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
expandCrossReference		☐		These expand fields are by default set to true, but w ill be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits		☐		Set to true to retrieve information about the units of measure connected to the item.
expandNote		☐		Set to true to retrieve the note value connected to the item.
expandSalesCategories		☐		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails		☐		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail		☐		Set to true to retrieve information about the w arehouse connected to the item.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
inventoryNumber		☐		The Item ID.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
salesCategory		☐		The Category ID for the sales category, found on the Attributes tab.
status		☐		The inventory item status (Values: Active, NoSales, NoPurchases, NoRequest, Inactive, MarkedForDeletion)

InventoryUnitItemClassAttributesByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitItemClassAttributesByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

default values for the second and fourth parameters and the specified values for the first and third.

InventoryUnitItemClassAttributesByInventoryNumber: Visma.net Financials Inventory Unit Item Class Attributes by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Unit Item Class Attributes by Inventory Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitItemClassAttributesByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryUnits: Visma.net Financials Inventory Units

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Units

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function InventoryUnits. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics		☐		This filter can be used only for stock items, from the Price/cost information tab.
alternateID		☐		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime		☐		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition		☐		System retrieved information for state/condition for attachment.
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}
availabilityLastModifiedDateTime		☐		System retrieved information.
availabilityLastModifiedDateTimeCondition		☐		System retrieved information for state/condition.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted

Name	Data Type	Required	Default Value	Documentation
				values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		A brief description of the stock item from the Top part of the window.
expandAccountInformation		☐		Set to true to retrieve information about the account information connected to the item.
expandAttachment		☐		Set to true to retrieve information about the attachments connected to the item.
expandAttribute		☐		Set to true to retrieve the attribute descriptions used for the item.
expandCrossReference		☐		These expand fields are by default set to true, but will be changed in the future. Set to true to retrieve information about the cross-references (item ID and suppliers/customers ID for the item connected to the item.
expandInventoryUnits		☐		Set to true to retrieve information about the units of measure connected to the item.
expandNote		☐		Set to true to retrieve the note value connected to the item.
expandSalesCategories		☐		Set to true to retrieve details about the sales categories connected to the item.
expandSupplierDetails		☐		Set to true to retrieve details about the supplier connected to the item.
expandWarehouseDetail		☐		Set to true to retrieve information about the warehouse connected to the item.
greaterThanValue		☐		Greater than value. The item which is the object for this, varies from API to API.
inventoryNumber		☐		The Item ID.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_

InventoryUnitsByInventoryNumber: Visma.net Financials Inventory Units by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Units by Inventory Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryUnitsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
inventoryNumber		☑		Identifies the Inventory item

InventoryWarehouseDetails: Visma.net Financials Inventory Warehouse Details

Get a range of Inventory items - ScreenId=IN202000 and IN202500Data for Inventory

Catalog: VismaNet

Schema: Inventory

Label: Inventory Warehouse Details

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryWarehouseDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
addCostPriceStatistics		☐		This filter can be used only for stock items, from the Price/cost information tab.
alternateID		☐		Applies for both Stock and Non-stock items. Some fields in this filter applies only for one of these.
attachmentLastModifiedDateTime		☐		System retrieved information for last modified date and time for attachment.
attachmentLastModifiedDateTimeCondition		☐		System retrieved information for state/condition for attachment.
attributes		☐		Attributes (additional information) connected to the entity.Examples: {{base}}/inventory?attributes={"AttributeID":"ValueID","AttributeID":"ValueID"} {{base}}/inventory?attributes={"AttributeID":"ValueID1,ValueID2"}
availabilityLastModifiedDateTime		☐		System retrieved information.
availabilityLastModifiedDateTimeCondition		☐		System retrieved information for state/condition.

InventoryWarehouseDetailsByInventoryId

Get a specific Inventory item by its internal ID

Catalog: VismaNet

Schema: Inventory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryWarehouseDetailsByInventoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

InventoryWarehouseDetailsByInventoryNumber: Visma.net Financials Inventory Warehouse Details by Inventory Number

Get a specific Inventory item

Catalog: VismaNet

Schema: Inventory

Label: Inventory Warehouse Details by Inventory Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryWarehouseDetailsByInventoryNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAdjustmentAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Schema: InventoryAdjustment

Label: Inventory Adjustment Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryAdjustmentLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function InventoryIssueAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
date		☐		The date when the inventory document was createdAccepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __Date__ and __DateCondition__ are __mutually inclusive__.
dateCondition		☐		This value represents the condition to be applied when retrieving records usind the __Date__ filter.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Date__ and __DateCondition__ are __mutually inclusive__.
greaterThanValue		☐		
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_

Name	Data Type	Label	Required	Documentation
date	datetime	Date	☐	The date when the inventory document was created. All transactions included in this document will have this transaction date.
description	varchar2	Description	☐	A brief description of the inventory issue or its transactions.
errorInfo	varchar2	Error Message	☐	
externalReference	varchar2	External Reference	☐	The external reference number of the inventory issue document (for example, the vendor's reference code).
hold	char	Hold	☐	A check box that you select to give the receipt the On Hold status. Clear the check box to save the receipt with the Balanced status.
id	guid	ID	☐	The ID of the attachment
lastModifiedDateTime	datetime	Last Modified	☐	The date when the document was last modified.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
name	varchar2	Name	☐	The name of the attachment.
postPeriod	varchar2	Post Period	☐	The financial period to which the transactions recorded in the document should be posted. Format MMYYYY.
referenceNumber	varchar2	Reference Number	☐	The unique reference number of the receipt, which the system automatically assigns according to the numbering sequence selected for receipts on the Inventory Preferences IN.10.10.00) form.
revision	int32	Revision	☐	The version of the attachment.
status	varchar2	Status	☐	The current status of the receipt. The following options are available: On Hold:The receipt/issue is a draft and can be edited. Receipts with this status cannot be released.Balanced: The receipt/issue data has been validated by the system and the receipt can be released. It also can be modified or deleted, but changes can be saved only if the receipt is balanced.Released: The receipt/issue has been released and cannot be edited or deleted.
timestamp	varchar2	Timestamp	☐	Timestamp of the inventory document

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
totalAmount	double	Total Amount	☐	The top part > Total amount > The total amount, calculated as a sum of amounts for all inventory issue operations included in this issue document.
totalQuantity	double	Total Quantity	☐	The total quantity of inventory items, w hich the system calculates automatically, for the document.

InventoryIssueLinesByInventoryIssueNumber: Visma.net Financials Inventory Issue Lines by Inventory Issue Number

Get a specific Inventory Issue document

Catalog: VismaNet

Schema: InventoryIssue

Label: Inventory Issue Lines by Inventory Issue Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryIssueLinesByInventoryIssueNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
inventoryIssueNumber		☑		Identifies the Inventory Issue document

Columns of Table Function

The columns of the table function InventoryIssueLinesByInventoryIssueNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
batchNumber	varchar2	Batch Number	☐	The reference number of the batch generated for the receipt. Click the number to open the Journal Transactions (GL.30.10.00) form and view the details of the transactions.

Label: Inventory Receipt Line Attachments by Inventory Receipt Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryReceiptLineAttachmentsByInventoryReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
inventoryReceiptNumber		☑		Identifies the Inventory Issue document

Columns of Table Function

The columns of the table function InventoryReceiptLineAttachmentsByInventoryReceiptNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
batchNumber	varchar2	Batch Number	☐	The reference number of the batch generated for the receipt. Click the number to open the Journal Transactions (GL.30.10.00) form and view the details of the transactions.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.

Name	Data Type	Label	Required	Documentation
controlCost	double	Control Cost	☐	The total cost of the inventory items to be received. Control Cost is available only if the Validate Document Totals on Entry option is selected on the Inventory Preferences form. The user enters this value manually to confirm the total cost as calculated automatically for the document. If the Control Cost and Total Cost values do not match, the system generates a warning message and the document cannot be saved.
controlQuantity	double	Control Quantity	☐	The manually entered quantity of inventory items. Control Qty. is available only if the Validate Document Totals on Entry option is selected on the Inventory Preferences form. If the Control Qty. and Total Qty.values do not match, the system generates a warning message and the issue cannot be saved.
date	datetime	Date	☐	The date when the inventory document was created. All transactions included in this document will have this transaction date.
description_2	varchar2	Description 2	☐	A brief description of the inventory issue or its transactions.
description	varchar2	Description	☐	Description > A brief description of the goods transfer transaction.
errorInfo	varchar2	Error Message	☐	
extCost	double	Extended Cost	☐	Cost > The extended cost of the received stock item. An extended cost is calculated automatically as the unit cost multiplied by the quantity (or amount) of item that was received.
externalReference	varchar2	External Reference	☐	The external reference number of the inventory issue document (for example, the vendor's reference code).
hold	char	Hold	☐	A check box that you select to give the receipt the On Hold status. Clear the check box to save the receipt with the Balanced status.
id	guid	ID	☐	The ID of the attachment
inventoryItem_description	varchar2		☐	Name of item/description
inventoryItem_number	varchar2		☐	Number of item
lastModifiedDateTime	datetime	Last Modified	☐	The date when the document was last modified.

Label: Inventory Summary by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function InventorySummaryByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

InventoryTransferLineAllocationsByInventoryTransferNumber: Visma.net Financials Inventory Transfer Line Allocations by Inventory Transfer Number

Get a specific Inventory Transfer document

Catalog: VismaNet

Schema: InventoryTransfer

Label: Inventory Transfer Line Allocations by Inventory Transfer Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function InventoryTransferLineAllocationsByInventoryTransferNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function JournalTransactionLineAttachmentsV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Branch to query data for.
expandAttachments		☐		If true, includes all attachments for batch. Default is false.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Mandatory if 'PeriodId' is not provided. Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```
module		☐		Module to query data for. Allow ed values: GL, AP, AR, CM, CA, IN, DR, FA, PM
periodId		☐		Financial Period to query data for. Mandatory if 'LastModifiedDateTime' not provided. Format: YYYYPP
status		☐		Journal transaction status to query data for. Available statuses : Hold, Balanced, Unposted, Posted, Voided, Scheduled, Unreleased. (Values: Hold, Balanced, Unposted, Posted, Voided, Scheduled, Unreleased)

JournalTransactionLinesByPeriodOrDateV2: Visma.net Financials Journal Transaction Line Attachments by Period or Date

Get a range of Journal Transactions - ScreenId=GL301000. On this particular endpoint, pagesize and totalcount denotes number of journaltransaction lines. When using pagination, the transactions for one specific batch can be split into several responses. Please use a page size lower or equal to the allowed max page size which is returned under metadata. If pagesize is greater than the max page size, it will be limited to max page size.Data for Journal Transaction

Catalog: VismaNet

Schema: JournalTransactionV2

Label: Journal Transaction Line Attachments by Period or Date

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function JournalTransactionLinesByPeriodOrDateV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Branch to query data for.
expandAttachments		☐		If true, includes all attachments for batch. Default is false.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Mandatory if 'PeriodId' is not provided. Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```
module		☐		Module to query data for. Allow ed values: GL, AP, AR, CM, CA, IN, DR, FA, PM

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
periodId		☐		Financial Period to query data for. Mandatory if 'LastModifiedDateTime' not provided. Format: YYYYPP
status		☐		Journal transaction status to query data for. Available statuses : Hold, Balanced, Unposted, Posted, Voided, Scheduled, Unreleased. (Values: Hold, Balanced, Unposted, Posted, Voided, Scheduled, Unreleased)

Columns of Table Function

The columns of the table function JournalTransactionLinesByPeriodOrDateV2 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accountNumber	varchar2	General Ledger Account Number	☐	Mandatory field: The table > Account* > The account (associated with the specified branch) whose balance will be updated by the journal entry.
autoReversing	char		☐	The top part > Automatic reversing > A check box that indicates (if selected) that the batch is auto-reversing.
batchNumber	varchar2	Batch Number	☐	The top part > Batch number > The unique ID of the batch, which is generated by the numbering sequence assigned to batches in the GL102000 window.
branch_2	varchar2		☐	The top part > Branch > The branch to which this batch is related. This field is available if your company is set up with branches.
branch	varchar2	Branch	☐	The table > Branch > The branch associated with this journal entry.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlTotal	double	Total for Control	☐	The top part > Control total > The control total of the batch, which is used for batch status validation.
controlTotalInCurrency	double		☐	Background calculation giving you the Control total in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
createVatTransaction	char		☐	The top part > Create VAT transactions > A check box that indicates (if selected) that a VAT-related transaction can be created manually; select this check box w hen you begin to create the transaction.
creditAmount	double	Credit Amount	☐	The table > Credit amount > The credit amount of the journal entry.
creditAmountInCurrency	double		☐	Background calculation giving you the Credit amount in your default currency. This field is applicable if the amount is given in another currency than your default.
creditTotal	double		☐	The top part > Credit total > The total of transaction credit amounts for the batch; the value is calculated automatically.
creditTotalInCurrency	double		☐	Background calculation giving you the Credit total in your default currency. This field is applicable if the amount is given in a another currency than your default.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency used for all the journal transactions in the selected batch.
customerSupplier	varchar2		☐	The table > Customer/Supplier > The customer or supplier associated w ith the entry.
debitAmount	double	Debit Amount	☐	The table > Debit amount > The debit amount of the journal entry.
debitAmountInCurrency	double		☐	Background calculation giving you the debit amount in your default currency. This field is applicable if the amount is given in another currency than your default.
debitTotal	double	Debit Total	☐	The top part > Debit total > The total of transaction debit amounts for the batch; the value is calculated automatically.
debitTotalInCurrency	double		☐	Background calculation giving you the Debit total in your default currency. This field is applicable if the amount is given in another currency than your default.
description_2	varchar2	Description 2	☐	The top part > Description > A description of the batch.
description	varchar2	Description	☐	The table > Description > A detailed description provided by a user or generated by the system.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Branch to query data for.
expandAttachments		☐		If true, includes all attachments for batch. Default is false.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Mandatory if 'PeriodId' is not provided. Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```
module		☐		Module to query data for. Allow ed values: GL, AP, AR, CM, CA, IN, DR, FA, PM
periodId		☐		Financial Period to query data for. Mandatory if 'LastModifiedDateTime' not provided. Format: YYYYPP
status		☐		Journal transaction status to query data for. Available statuses : Hold, Balanced, Unposted, Posted, Voided, Scheduled, Unreleased. (Values: Hold, Balanced, Unposted, Posted, Voided, Scheduled, Unreleased)

Columns of Table Function

The columns of the table function JournalTransactionLineSubaccountSegmentsByPeriodOrDateV2 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
accountNumber	varchar2	General Ledger Account Number	☐	Mandatory field: The table > Account* > The account (associated w ith the specified branch) w hose balance w ill be updated by the journal entry.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
active	char	Active	☐	Active > The status of the identifier.
autoReversing	char		☐	The top part > Automatic reversing > A check box that indicates (if selected) that the batch is auto-reversing.
batchNumber	varchar2	Batch Number	☐	The top part > Batch number > The unique ID of the batch, which is generated by the numbering sequence assigned to batches in the GL102000 window.
branch_2	varchar2		☐	The top part > Branch > The branch to which this batch is related. This field is available if your company is set up with branches.
branch	varchar2	Branch	☐	The table > Branch > The branch associated with this journal entry.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlTotal	double	Total for Control	☐	The top part > Control total > The control total of the batch, which is used for batch status validation.
controlTotalInCurrency	double		☐	Background calculation giving you the Control total in your default currency. This field is applicable if the amount is given in another currency than your default.
createVatTransaction	char		☐	The top part > Create VAT transactions > A check box that indicates (if selected) that a VAT-related transaction can be created manually; select this check box when you begin to create the transaction.
creditAmount	double	Credit Amount	☐	The table > Credit amount > The credit amount of the journal entry.
creditAmountInCurrency	double		☐	Background calculation giving you the Credit amount in your default currency. This field is applicable if the amount is given in another currency than your default.
creditTotal	double		☐	The top part > Credit total > The total of transaction credit amounts for the batch; the value is calculated automatically.
creditTotalInCurrency	double		☐	Background calculation giving you the Credit total in your default currency. This field is

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				applicable if the amount is given in a another currency than your default.
currencyId	varchar2	Currency ID	☐	The top part > Currency > The currency used for all the journal transactions in the selected batch.
customerSupplier	varchar2		☐	The table > Customer/Supplier > The customer or supplier associated w ith the entry.
debitAmount	double	Debit Amount	☐	The table > Debit amount > The debit amount of the journal entry.
debitAmountInCurrency	double		☐	Background calculation giving you the debit amount in your default currency. This field is applicable if the amount is given in another currency than your default.
debitTotal	double	Debit Total	☐	The top part > Debit total > The total of transaction debit amounts for the batch; the value is calculated automatically.
debitTotalInCurrency	double		☐	Background calculation giving you the Debit total in your default currency. This field is applicable if the amount is given in another currency than your default.
description_2	varchar2	Description 2	☐	The table > Description > A detailed description provided by a user or generated by the system.
description_3	varchar2		☐	The top part > Description > A description of the batch.
description	varchar2	Description	☐	Description > The description of the identifier.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	Ingformation collected from the system to calculate currency amount.
financialPeriod	varchar2	Financial Period	☐	Mandatory field: The top part Post period* > The financial period to w hich the transactions should be posted. Format YYYYMM.
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the batch has the On hold status and cannot be released or posted. You can clear the check box only if the batch has total debits equal to total credits.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
inventoryNumber	varchar2	Inventory Number	☐	Item ID > The item ID of the line item, if applicable.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	System generated information.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
ledger	varchar2	Ledger	☐	Mandatory field: The top part > Ledger* > The unique ID of the ledger to w hich batch transactions are posted. By default, it is the default posting ledger specified for the branch in the GL101010 w indow , but another posting ledger can be selected.
ledgerDescription	varchar2	Ledger Description	☐	Mandatory field: The top part > Ledger* > Click the magnifier > The description of the ledger to w hich batch transactions are posted. By default, it is the default posting ledger specified for the branch in the GL101010 w indow , but another posting ledger can be selected.
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	
module_2	varchar2		☐	The top part > Workspace > The w orkspace w here the batch originates. New batches can be created only for General ledger.
module	varchar2	Module	☐	The w orkspace w here the batch originates. See module in the Top part > Workspace
note	varchar2	Note	☐	
originalBatchNumber	varchar2		☐	The top part > Orig. batch number > For a scheduled or auto-reversing batch, the reference number of the batch used as a template.
postPeriod	varchar2	Post Period	☐	Mandatory field: The top part > Post period* > The financial period to w hich the transactions recorded in the document should be posted. Format MMYYYY.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of items associated w ith the transaction, if relevant.
referenceNumber	varchar2	Reference Number	☐	The table > Ref. no. > The reference number of the external or internal document associated w ith the journal transaction.
reversingEntry	char		☐	The top part > Reversing entry > A check box that indicates (if selected) that the batch is a reversing batch. The Orig.batch number field displays the ID of the batch that w as reversed by this batch.
segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values w indow > The Top part > The ID of the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values w indow > The table > The description of the segment value.
skipVatAmountValidation	char		☐	The top part > Skip VAT amount validation > A check box that (if selected) causes automatic validation of a VAT-related transaction that you create manually to be skipped.
status	varchar2	Status	☐	The top part > Status > The current status of the batch. The status defines w hat processing can be applied to the batch. The follow ing options are available: On hold, Balanced, Scheduled, Unposted, Posted, Void.
subaccountId	int32		☐	SubID > The identifier of the subaccount.
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
timeStamp_2	blob		☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.
transactionCode	varchar2		☐	
transactionCodeDescription	varchar2		☐	The Table part > Transaction description > A description of the transaction or any comments relevant to the transaction.
transactionDate	datetime		☐	Mandatory field: The top part > Transaction date* > The date when the batch was created, which relates to the transaction dates of the journal entries.
transactionDescription	varchar2		☐	The table > Transaction Description > A description of the transaction or any comments relevant to the transaction.
transactionType	varchar2		☐	The top part > Type > The type of this general ledger batch, which is specified by the system automatically.
uom	varchar2	Unit of Measure	☐	The table > UoM > The quantity of items associated with the transaction, if relevant.
vat_description	varchar2		☐	Click on the magnifier. > The description.
vat_id	varchar2	VAT ID	☐	Click on the magnifier. > The identifier.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.

JournalTransactionsByNumberV2: Visma.net Financials Journal Transactions by Number

Get a specific Journal TransactionData for Journal TransactionThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: JournalTransactionV2

Label: Journal Transactions by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function JournalTransactionsByNumberV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

KitAssemblyStockComponentLineAllocationsByTypeRefNumber: Visma.net Financials Kit Assembly Stock Component Line Allocations by Type Reference Number

Get a Kit Assembly - ScreenId = IN307000

Catalog: VismaNet

Schema: KitAssembly

Label: Kit Assembly Stock Component Line Allocations by Type Reference Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function KitAssemblyStockComponentLineAllocationsByTypeRefNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function KitSpecificationRecordStockComponentLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Locations. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
gln		☐		
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:*

Catalog: VismaNet

Schema: LotSerialClass

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function LotSerialClassDetailsById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
id		☑		Identifies the LotSerialClass

Columns of Table Function

The columns of the table function LotSerialClassDetailsById are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
assignmentMethod	varchar2		☐	Assignment method used for the Lot Serial Class (When Used, When Received)
autoGenerateNextNumber	char		☐	Option for enable/disable auto generating the next number for the Lot Serial Class
autoIncrementalValue	varchar2		☐	Value used for the auto incremental value w hen AutoIncrementalValueBetw eenCl asses is enabled
autoIncrementalValueBetw eenClas ses	char		☐	Option for enable/disable auto incremental values betw een classes for the Lot Serial Class
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
description	varchar2	Description	☐	The description of the Lot Serial Class
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
id_2	varchar2		☐	The Id of the Lot Serial Class
id	varchar2	ID	☐	The Id of the Lot Serial Class
issueMethod	varchar2		☐	Issue method used for the Lot Serial Class (FIFO, LIFO, Sequential, Expiration, User-Enterable)
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐

BranchesByOrganizationCode: Visma.net Financials Branches by Organisation Code

Get organisation information by organization number.Data for a single organization. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Organization

Label: Branches by Organisation Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function BranchesByOrganizationCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
expandBankSettings		☐		True to expand payment settings for organization.
expandBranches		☐		True to expand all Branches related to this Organization.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
organizationNumber		☑		The organisation code.

PaymentLinesByNumber: Visma.net Financials Payment Lines by Number

Get a specific PaymentPayment is deprecated, please use CustomerPayment instead.

Catalog: VismaNet

Schema: Payment

Label: Payment Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PaymentLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Payments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter by Branch
customer		☐		Enter Customer
docDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-

Columns of Table Function

The columns of the table function Payments are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

Name	Data Type	Label	Required	Documentation
applicationDate	datetime	Application Date	☐	Mandatory field: The top part > Date* > The date when a payment is applied to a document (invoice or note). The field display the current business date for tunapplied or partially applied payments and the latest application date for the closed payment
applicationPeriod	varchar2	Application Period	☐	Mandatory field: The top part > Financial period* > The period to which the payment should be applied, which the system fills in based on the date.
appliedToDocuments	double		☐	The top part > Applied to documents > The total of the documents to which payment is to be applied.
appliedToOrders	double		☐	The top part > Applied to orders > The total of the orders for which payment is reserved, minus the amount transferred to invoice.
availableBalance	double	Available Balance	☐	The top part > Available balance > The amount that has not been applied.
availableBalanceInCurrency	double		☐	Available Balance calculated in your default (base) currency. This field is applicable if the amount is given in another currency than your default.
branch	varchar2	Branch	☐	
cashAccount	varchar2	Cash Account	☐	Mandatory field: The top part > Cash account* > The default cash account associated with the payment method; this field is not available for credit notes.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
currency	varchar2	Currency	☐	The top part > Currency > The currency of the payment document.
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deductedCharges	double	Deducted Charges	☐	The top part > Deducted charges > The total amount of bank charges deducted by bank from the payment amount on your cash account (bank account).
errorInfo	varchar2	Error Message	☐	
financeCharges	double	Finance Charges	☐	The top part > Finance charges > The total on all finance charges applied to this document.
financialDetails_paymentDate	datetime		☐	Financial Details tab > Payment date
hold	char	Hold	☐	The top part > Hold > A check box that indicates (if selected) that the document is a draft w ith the On hold status. This check box is unavailable for debit adjustments.
invoiceText	varchar2	Invoice Text	☐	The top part > Invoice text > A user-defined description of the payment. 50 alphanumeric characters.
lastModifiedDateTime	datetime	Last Modified	☐	Systemgenerated information.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name

ProjectAttributesByInternalId

Get a specific Project by internal IDData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectAttributesByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ProjectById: Visma.net Financials Project by ID

Get a specific ProjectData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

Label: Project by ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
				values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
nonProject		☐		Set to true to return the non-project.
onHold		☐		If the project is on hold
publicId		☐		Identifies the Project by its publicId
restrictedEmployee		☐		ID of the employee where access restrictions apply
restrictedUser		☐		Id of the odp user where access restrictions apply
startDate		☐		Project's start date
status		☐		Use drop down and select Status. (Values: Planned, Active, Completed, Cancelled, OnHold, PendingApproval)
systemTemplate		☐		If the project is a template
taskStatus		☐		Use drop down and select Status. (Values: Planned, Active, Cancelled, Canceled, Completed)
taskVisibleInAp		☐		If the project task is visible in the Supplier ledger
taskVisibleInAr		☐		If the project task is visible in the Customer ledger
taskVisibleInCa		☐		If the project task is visible in the Cash management workspace
taskVisibleInCr		☐		If the project task is visible in the CRM workspace
taskVisibleInEa		☐		If the project task is visible in the Expense workspace
taskVisibleInGl		☐		If the project task is visible in the General ledger workspace
taskVisibleInIn		☐		If the project task is visible in the Inventory workspace
taskVisibleInPo		☐		If the project task is visible in the Purchases workspace
taskVisibleInSo		☐		If the project task is visible in the Sales workspace
taskVisibleInTa		☐		If the project task is visible in the Time entities workspace
visibleInAP		☐		If the project is visible in AP

Columns of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The columns of the table function ProjectEmployees are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.
allocationRule_active	char	Allocation Rule Active	☐	
allocationRule_description	varchar2	Allocation Rule Description	☐	Click on the magnifier. > The description.
allocationRule_id	varchar2	Allocation Rule ID	☐	Click on the magnifier. > The identifier.
assets	double	Assets	☐	The top part > Assest > The actual assets for the project.
autoAllocate	char	Auto Allocate	☐	Summary tab > Invoicing and allocation settings section > Run allocation w hen you release project transactions > A check box that indicates (if selected) that allocation is run automatically during the release of the documents associated w ith this project.
automaticReleaseAr	char	Automatic Release AR	☐	Summary tab > Invoicing and allocation settings section > Automatically release customer documents > A check box that indicates (if selected) that invoice documents are released

Name	Data Type	Label	Required	Documentation
				automatically after the project invoicing is completed.
billingPeriod	varchar2	Billing Period	☐	Summary tab > Invoicing and allocation settings section > Invoicing period > The frequency of invoicing, w hich can be one of the follow ing options: Week, Month, Quarter, Year, On demand.
billingRule_active	char	Billing Rule Active	☐	
billingRule_description	varchar2	Billing Rule Description	☐	Click on the magnifier. > The description.
billingRule_id	varchar2	Billing Rule ID	☐	Click on the magnifier. > The identifier.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
calendarID	varchar2	Calendar ID	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
contact_contactId	int32	Contact ID	☐	
contact_email	varchar2	Contact Email	☐	Email > The email address of the customer/supplier/company as a business entity.
contact_employeeContact	varchar2	Contact Employee Contact	☐	Employee contact > The link to the contact record associated w ith the employee.
contact_fax	varchar2	Contact Fax	☐	Fax > The fax number.
contact_firstName	varchar2	Contact First Name	☐	First name > The first name of the employee.
contact_lastName	varchar2	Contact Last Name	☐	Mandatory field: Last name* > The last name of the employee.
contact_midName	varchar2	Contact Middle Name	☐	Middle name > The middle name of the employee.
contact_name	varchar2	Contact Name	☐	Name > The legal name of to appear on the documents.
contact_phone1	varchar2	Contact Phone 1	☐	Phone 1 > The default phone number.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
contact_phone2	varchar2	Contact Phone 2	☐	Phone 2 > An additional phone number.
contact_phone3	varchar2	Contact Phone 3	☐	Phone 3 > An additional phone number of the employee.
contact_title	varchar2	Contact Title	☐	Title > The courtesy title to be used for the employee.
contact_web	varchar2	Contact Website	☐	Web > The website of the company, if one exists.
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerLocation_id	int32	Customer Location ID	☐	Click the magnifier > The identifier
customerLocation_name	varchar2	Customer Location Name	☐	Click the magnifier > The displayed name
defAccount_description	varchar2	Default Account Description	☐	Name of item/description
defAccount_number	varchar2	Default Account Number	☐	Number of item
defAccount_type	varchar2	Default Account Type	☐	
defAccrualAccount_description	varchar2	Default Accrual Account Description	☐	Name of item/description
defAccrualAccount_number	varchar2	Default Accrual Account Number	☐	Number of item
defAccrualAccount_type	varchar2	Default Accrual Account Type	☐	
defAccrualSub_active	char	Default Accrual Account Sub Active	☐	
defAccrualSub_description	varchar2	Default Accrual Account Sub Description	☐	Click on the magnifier. > The description.
defAccrualSub_id	varchar2	Default Accrual Account Sub ID	☐	Click on the magnifier. > The identifier.
defSub_active	char	Default Sub Active	☐	
defSub_description	varchar2	Default Sub Description	☐	Click on the magnifier. > The description.
defSub_id	varchar2	Default Sub ID	☐	Click on the magnifier. > The identifier.
department	varchar2	Department	☐	Mandatory field: General information tab > Employee section > Department* > The department the employee works for.
description	varchar2	Description	☐	Mandatory field: The top part > Description* > The description of the project.
employeeClass_description	varchar2	Employee Class Description	☐	Click on the magnifier. > The description.
employeeClass_id	varchar2	Employee Class ID	☐	Click on the magnifier. > The identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
employeeId	int32	Employee ID	☐	Mandatory field: The top part > Employee ID* > The unique identifier, which is assigned to the employee in accordance with the configuration of the EMPLOYEE segmented key.
employeeLogin	varchar2	Employee Login	☐	
employeeName	varchar2	Employee Name	☐	The top part > Employee name > The name of this employee.
employeeNumber	varchar2	Employee Number	☐	General information tab > Employee settings section > Employee ref. no. > A reference number for the employee.
employeeUserId	guid	Employee User ID	☐	Employee internal user ID. This is the ID of the user linked to the employee
endDate	datetime	End Date	☐	Summary tab > Project properties section > End date > The date when the project is expected to end.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
expenses	double	Expenses	☐	The top part > Expenses > The total of the current expenses incurred by the project.
hold	char	Hold	☐	The top part > Hold > A check box that you select to indicate that the project should have the In planning status.
income	double	Income	☐	The top part > Income > The income expected from the project.
internalID	int32	Internal ID	☐	
lastBillingDate	datetime	Last Billing Date	☐	Summary tab > Invoicing and allocation settings section > Last invoicing date > The date when the latest invoicing was performed for the project.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	System generated information
lastModifiedDateTime	datetime	Last Modified	☐	
liability	double	Liability	☐	The top part > Liabilities > The actual liabilities for the project.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐

visibility_visibleInTa	char		☐	Time entries

ProjectEmployeesById: Visma.net Financials Project Employees by ID

Get a specific ProjectData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

Label: Project Employees by ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectEmployeesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
projectID		☑		Identifies the Project

Columns of Table Function

The columns of the table function ProjectEmployeesById are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.
allocationRule_active	char	Allocation Rule Active	☐	
allocationRule_description	varchar2	Allocation Rule Description	☐	Click on the magnifier. > The description.
allocationRule_id	varchar2	Allocation Rule ID	☐	Click on the magnifier. > The identifier.
assets	double	Assets	☐	The top part > Assest > The actual assets for the project.
autoAllocate	char	Auto Allocate	☐	Summary tab > Invoicing and allocation settings section > Run allocation w hen you release

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				project transactions > A check box that indicates (if selected) that allocation is run automatically during the release of the documents associated w ith this project.
automaticReleaseAr	char	Automatic Release AR	☐	Summary tab > Invoicing and allocation settings section > Automatically release customer documents > A check box that indicates (if selected) that invoice documents are released automatically after the project invoicing is completed.
billingPeriod	varchar2	Billing Period	☐	Summary tab > Invoicing and allocation settings section > Invoicing period > The frequency of invoicing, w hich can be one of the follow ing options: Week, Month, Quarter, Year, On demand.
billingRule_active	char	Billing Rule Active	☐	
billingRule_description	varchar2	Billing Rule Description	☐	Click on the magnifier. > The description.
billingRule_id	varchar2	Billing Rule ID	☐	Click on the magnifier. > The identifier.

Get a specific Project by internal IDData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function ProjectEmployeesByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the Project

Columns of Table Function

The columns of the table function ProjectEmployeesByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectEmployeeWorkGroupDescriptionsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalID		☑		Identifies the Project

Columns of Table Function

The columns of the table function ProjectEmployeeWorkGroupDescriptionsByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.

ProjectEmployeeWorkGroupDescriptionsByProjectId

Get a specific ProjectData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectEmployeeWorkGroupDescriptionsByProjectId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ProjectManagerWorkGroupDescriptionByInternalId

Get a specific Project by internal IDData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectManagerWorkGroupDescriptionByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ProjectManagerWorkGroupDescriptionByProjectId

Get a specific ProjectData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectManagerWorkGroupDescriptionByProjectId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
projectID		☑		Identifies the Project

Columns of Table Function

The columns of the table function ProjectManagerWorkGroupDescriptionByProjectId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Projects. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Identifies the attributes

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskAttributes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ProjectTaskAttributes2

Get all tasks for a project

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskAttributes2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		Identifies the Project task description
expandAttribute		☐		Expands project atributes

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
projectId		☐		Identifies the Project
projectInternalId		☐		Identifies the project by internal id
publicId		☐		Identifies the project by publicId
restrictedEmployee		☐		Id of the employee where access restrictions apply
restrictedUser		☐		Id of the Odp User where access restrictions apply
status		☐		The status of the document. (Values: Planned, Active, Cancelled, Canceled, Completed)
taskCd		☐		Identifies the Project task ID
taskCdDesc		☐		Identifies the Project task ID and description
visibleInAp		☐		If the project task is visible in the Supplier ledger
visibleInAr		☐		If the project task is visible in the Customer ledger
visibleInCa		☐		If the project task is visible in the Cash management workspace
visibleInCr		☐		If the project task is visible in the CRM workspace
visibleInEa		☐		If the project task is visible in the Expense workspace
visibleInGl		☐		If the project task is visible in the General ledger workspace

ProjectTaskEmployees: Visma.net Financials Project Task Employees

Get a range of Projects - ScreenId=PM301000The requested page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: Project

Label: Project Task Employees

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskEmployees. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Identifies the attributes

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
branch		☐		The branch name.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
expandAttribute		☐		Expands project atributes
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
nonProject		☐		Set to true to return the non-project.
onHold		☐		If the project is on hold
publicId		☐		Identifies the Project by its publicId
restrictedEmployee		☐		ID of the employee w here access restrictions apply

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
restrictedUser		☐		Id of the odp user where access restrictions apply
startDate		☐		Project's start date
status		☐		Use drop down and select Status. (Values: Planned, Active, Completed, Cancelled, OnHold, PendingApproval)
systemTemplate		☐		If the project is a template
taskStatus		☐		Use drop down and select Status. (Values: Planned, Active, Cancelled, Canceled, Completed)
taskVisibleInAp		☐		If the project task is visible in the Supplier ledger
taskVisibleInAr		☐		If the project task is visible in the Customer ledger
taskVisibleInCa		☐		If the project task is visible in the Cash management workspace
taskVisibleInCr		☐		If the project task is visible in the CRM workspace
taskVisibleInEa		☐		If the project task is visible in the Expense workspace
taskVisibleInGl		☐		If the project task is visible in the General ledger workspace
taskVisibleInIn		☐		If the project task is visible in the Inventory workspace
taskVisibleInPo		☐		If the project task is visible in the Purchases workspace
taskVisibleInSo		☐		If the project task is visible in the Sales workspace
taskVisibleInTa		☐		If the project task is visible in the Time entities workspace
visibleInAP		☐		If the project is visible in AP

Columns of Table Function

The columns of the table function ProjectTaskEmployees are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.

Name	Data Type	Label	Required	Documentation
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name_3	varchar2		☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number_3	varchar2		☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
calendarID	varchar2	Calendar ID	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
contact_contactId	int32	Contact ID	☐	
contact_email	varchar2	Contact Email	☐	Email > The email address of the customer/supplier/company as a business entity.
contact_employeeContact	varchar2	Contact Employee Contact	☐	Employee contact > The link to the contact record associated with the employee.
contact_fax	varchar2	Contact Fax	☐	Fax > The fax number.
contact_firstName	varchar2	Contact First Name	☐	First name > The first name of the employee.
contact_lastName	varchar2	Contact Last Name	☐	Mandatory field: Last name* > The last name of the employee.
contact_midName	varchar2	Contact Middle Name	☐	Middle name > The middle name of the employee.
contact_name	varchar2	Contact Name	☐	Name > The legal name of to appear on the documents.
contact_phone1	varchar2	Contact Phone 1	☐	Phone 1 > The default phone number.
contact_phone2	varchar2	Contact Phone 2	☐	Phone 2 > An additional phone number.
contact_phone3	varchar2	Contact Phone 3	☐	Phone 3 > An additional phone number of the employee.
contact_title	varchar2	Contact Title	☐	Title > The courtesy title to be used for the employee.
contact_web	varchar2	Contact Website	☐	Web > The website of the company, if one exists.

defAccrualSub_id	varchar2	Default Accrual Account Sub ID	☐	Click on the magnifier. > The identifier.
defSub_active	char	Default Sub Active	☐	
defSub_description	varchar2	Default Sub Description	☐	Click on the magnifier. > The description.
defSub_id	varchar2	Default Sub ID	☐	Click on the magnifier. > The identifier.
department	varchar2	Department	☐	Mandatory field: General information tab > Employee section > Department* > The department the employee works for.
description_2	varchar2	Description 2	☐	Mandatory field: The top part > Description* > The description of the project.
description	varchar2	Description	☐	Mandatory field: Description > The description of the task.
employeeClass_description	varchar2	Employee Class Description	☐	Click on the magnifier. > The description.
employeeClass_id	varchar2	Employee Class ID	☐	Click on the magnifier. > The identifier.
employeeId	int32	Employee ID	☐	Mandatory field: The top part > Employee ID* > The unique identifier, which is assigned to the employee in accordance with the configuration of the EMPLOYEE segmented key.
employeeLogin	varchar2	Employee Login	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
employeeName	varchar2	Employee Name	☐	The top part > Employee name > The name of this employee.
employeeNumber	varchar2	Employee Number	☐	General information tab > Employee settings section > Employee ref. no. > A reference number for the employee.
employeeUserId	guid	Employee User ID	☐	Employee internal user ID. This is the ID of the user linked to the employee
endDate_2	datetime		☐	Summary tab > Project properties section > End date > The date w hen the project is expected to end.
endDate	datetime	End Date	☐	End date > The date w hen the task w as actually finished.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
expenses	double	Expenses	☐	The top part > Expenses > The total of the current expenses incurred by the project.
hold	char	Hold	☐	The top part > Hold > A check box that you select to indicate that the project should have the In planning status.
income	double	Income	☐	The top part > Income > The income expected from the project.
internalID	int32	Internal ID	☐	
lastBillingDate	datetime	Last Billing Date	☐	Summary tab > Invoicing and allocation settings section > Last invoicing date > The date w hen the latest invoicing w as performed for the project.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	System generated information
lastModifiedDateTime	datetime	Last Modified	☐	
liability	double	Liability	☐	The top part > Liabilities > The actual liabilities for the project.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	
nextBillingDate	datetime	Next Billing Date	☐	Summary tab > Invoicing and allocation settings section > Next invoicing date > The date for w hich the next invoicing is scheduled for the project.
note	varchar2	Note	☐	The note on the project.

Columns of Table Function

The columns of the table function ProjectTaskEmployeesByInternalId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.
allocationRule_active	char	Allocation Rule Active	☐	
allocationRule_description	varchar2	Allocation Rule Description	☐	Click on the magnifier. > The description.
allocationRule_id	varchar2	Allocation Rule ID	☐	Click on the magnifier. > The identifier.
assets	double	Assets	☐	The top part > Assest > The actual assets for the project.

The columns of the table function ProjectTaskEmployeesWorkGroupDescriptions are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
calendarID	varchar2	Calendar ID	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
contact_contactId	int32	Contact ID	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
contact_email	varchar2	Contact Email	☐	Email > The email address of the customer/supplier/company as a business entity.
contact_employeeContact	varchar2	Contact Employee Contact	☐	Employee contact > The link to the contact record associated w ith the employee.
contact_fax	varchar2	Contact Fax	☐	Fax > The fax number.
contact_firstName	varchar2	Contact First Name	☐	First name > The first name of the employee.
contact_lastName	varchar2	Contact Last Name	☐	Mandatory field: Last name* > The last name of the employee.
contact_midName	varchar2	Contact Middle Name	☐	Middle name > The middle name of the employee.
contact_name	varchar2	Contact Name	☐	Name > The legal name of to appear on the documents.
contact_phone1	varchar2	Contact Phone 1	☐	Phone 1 > The default phone number.
contact_phone2	varchar2	Contact Phone 2	☐	Phone 2 > An additional phone number.
contact_phone3	varchar2	Contact Phone 3	☐	Phone 3 > An additional phone number of the employee.
contact_title	varchar2	Contact Title	☐	Title > The courtesy title to be used for the employee.
contact_w eb	varchar2	Contact Website	☐	Web > The w ebsite of the company, if one exists.
createdDateTime	datetime	Created	☐	Information collected from the system. Not visible on the screen.
defAccount_description	varchar2	Default Account Description	☐	Name of item/description
defAccount_number	varchar2	Default Account Number	☐	Number of item
defAccount_type	varchar2	Default Account Type	☐	
defAccrualAccount_description	varchar2	Default Accrual Account Description	☐	Name of item/description
defAccrualAccount_number	varchar2	Default Accrual Account Number	☐	Number of item
defAccrualAccount_type	varchar2	Default Accrual Account Type	☐	
defAccrualSub_active	char	Default Accrual Account Sub Active	☐	
defAccrualSub_description	varchar2	Default Accrual Account Sub Description	☐	Click on the magnifier. > The description.
defAccrualSub_id	varchar2	Default Accrual Account Sub ID	☐	Click on the magnifier. > The identifier.
defSub_active	char	Default Sub Active	☐	
defSub_description	varchar2	Default Sub Description	☐	Click on the magnifier. > The description.

ProjectTaskEmployeeWorkGroupDescriptionByProjectId

Get a specific ProjectData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskEmployeeWorkGroupDescriptionByProjectId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the table function ProjectTaskEmployeeWorkGroupDescriptions. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Identifies the attributes
branch		☐		The branch name.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-

taskVisibleInSo		☐		If the project task is visible in the Sales w orkspace
taskVisibleInTa		☐		If the project task is visible in the Time entities w orkspace
visibleInAP		☐		If the project is visible in AP

Columns of Table Function

The columns of the table function ProjectTaskEmployeeWorkGroupDescriptions are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxP ageSize	int64		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.
allocationRule_active	char	Allocation Rule Active	☐	
allocationRule_description	varchar2	Allocation Rule Description	☐	Click on the magnifier. > The description.
allocationRule_id	varchar2	Allocation Rule ID	☐	Click on the magnifier. > The identifier.
assets	double	Assets	☐	The top part > Assest > The actual assets for the project.
autoAllocate	char	Auto Allocate	☐	Summary tab > Invoicing and allocation settings section > Run allocation w hen you release project transactions > A check box that indicates (if selected) that allocation is run automatically during the release of the documents associated w ith this project.
automaticReleaseAr	char	Automatic Release AR	☐	Summary tab > Invoicing and allocation settings section > Automatically release customer documents > A check box that indicates (if selected) that invoice documents are released automatically after the project invoicing is completed.
billingPeriod	varchar2	Billing Period	☐	Summary tab > Invoicing and allocation settings section > Invoicing period > The frequency of invoicing, w hich can be one of the follow ing options: Week, Month, Quarter, Year, On demand.
billingRule_active	char	Billing Rule Active	☐	
billingRule_description	varchar2	Billing Rule Description	☐	Click on the magnifier. > The description.
billingRule_id	varchar2	Billing Rule ID	☐	Click on the magnifier. > The identifier.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name_3	varchar2		☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number_3	varchar2		☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
calendarID	varchar2	Calendar ID	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
contact_contactId	int32	Contact ID	☐	
contact_email	varchar2	Contact Email	☐	Email > The email address of the customer/supplier/company as a business entity.
contact_employeeContact	varchar2	Contact Employee Contact	☐	Employee contact > The link to the contact record associated with the employee.
contact_fax	varchar2	Contact Fax	☐	Fax > The fax number.
contact_firstName	varchar2	Contact First Name	☐	First name > The first name of the employee.
contact_lastName	varchar2	Contact Last Name	☐	Mandatory field: Last name* > The last name of the employee.
contact_midName	varchar2	Contact Middle Name	☐	Middle name > The middle name of the employee.
contact_name	varchar2	Contact Name	☐	Name > The legal name of to appear on the documents.
contact_phone1	varchar2	Contact Phone 1	☐	Phone 1 > The default phone number.
contact_phone2	varchar2	Contact Phone 2	☐	Phone 2 > An additional phone number.
contact_phone3	varchar2	Contact Phone 3	☐	Phone 3 > An additional phone number of the employee.
contact_title	varchar2	Contact Title	☐	Title > The courtesy title to be used for the employee.
contact_web	varchar2	Contact Website	☐	Web > The website of the company, if one exists.
customer_name	varchar2	Customer Name	☐	Click the magnifier. > The name.
customer_number	varchar2	Customer Number	☐	
customerLocation_id	int32	Customer Location ID	☐	Click the magnifier > The identifier
customerLocation_name	varchar2	Customer Location Name	☐	Click the magnifier > The displayed name

ProjectTaskEmployeeWorkGroupDescriptionsByInternalId

Get a specific Project by internal IDData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskEmployeeWorkGroupDescriptionsByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ProjectTasks: Visma.net Financials Project Tasks

Get a range of Projects - ScreenId=PM301000The requested page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: Project

Label: Project Tasks

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTasks. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		Identifies the attributes
branch		☐		The branch name.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
expandAttribute		☐		Expands project atributes
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
nonProject		☐		Set to true to return the non-project.
onHold		☐		If the project is on hold
publicId		☐		Identifies the Project by its publicId

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
restrictedEmployee		☐		ID of the employee where access restrictions apply
restrictedUser		☐		Id of the odp user where access restrictions apply
startDate		☐		Project's start date
status		☐		Use drop down and select Status. (Values: Planned, Active, Completed, Cancelled, OnHold, PendingApproval)
systemTemplate		☐		If the project is a template
taskStatus		☐		Use drop down and select Status. (Values: Planned, Active, Cancelled, Canceled, Completed)
taskVisibleInAp		☐		If the project task is visible in the Supplier ledger
taskVisibleInAr		☐		If the project task is visible in the Customer ledger
taskVisibleInCa		☐		If the project task is visible in the Cash management workspace
taskVisibleInCr		☐		If the project task is visible in the CRM workspace
taskVisibleInEa		☐		If the project task is visible in the Expense workspace
taskVisibleInGl		☐		If the project task is visible in the General ledger workspace
taskVisibleInIn		☐		If the project task is visible in the Inventory workspace
taskVisibleInPo		☐		If the project task is visible in the Purchases workspace
taskVisibleInSo		☐		If the project task is visible in the Sales workspace
taskVisibleInTa		☐		If the project task is visible in the Time entities workspace
visibleInAP		☐		If the project is visible in AP

Columns of Table Function

The columns of the table function ProjectTasks are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

Catalog: VismaNet

Schema: Project

Label: Project Tasks

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTasks2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
description		☐		Identifies the Project task description
expandAttribute		☐		Expands project atributes
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
projectId		☐		Identifies the Project
projectInternalId		☐		Identifies the project by internal id
publicId		☐		Identifies the project by publicId
restrictedEmployee		☐		Id of the employee w here access restrictions apply
restrictedUser		☐		Id of the Odp User w here access restrictions apply
status		☐		The status of the document. (Values: Planned, Active, Cancelled, Canceled, Completed)
taskCd		☐		Identifies the Project task ID
taskCdDesc		☐		Identifies the Project task ID and description

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
visibleInAp		☐		If the project task is visible in the Supplier ledger
visibleInAr		☐		If the project task is visible in the Customer ledger
visibleInCa		☐		If the project task is visible in the Cash management w orkspace
visibleInCr		☐		If the project task is visible in the CRM w orkspace
visibleInEa		☐		If the project task is visible in the Expense w orkspace
visibleInGl		☐		If the project task is visible in the General ledger w orkspace
visibleInIn		☐		If the project task is visible in the Inventory w orkspace
visibleInPo		☐		If the project task is visible in the Purchases w orkspace
visibleInSo		☐		If the project task is visible in the Sales w orkspace
visibleInTa		☐		If the project task is visible in the Time entities w orkspace

ProjectTasksByInternalId: Visma.net Financials Project Tasks by Internal ID

Get a specific Project by internal IDData for a single projectThe response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Project

Label: Project Tasks by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTasksByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectAccountGroupAttributes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
expandAttribute		☐		Expands project atributes
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:*

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectBudgets. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and
