ProjectTaskEmployeesByInternalId: Visma.net Financials Project Task Employees by Internal ID

Get project task information by internal id.Data for a single project task. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: ProjectTask

Label: Project Task Employees by Internal ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskEmployeesByInternalId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
internalId		☑		The organisation code.

ProjectTaskEmployeeWorkGroupDescriptionsByInternalId2

Get project task information by internal id.Data for a single project task. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: ProjectTask

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTaskEmployeeWorkGroupDescriptionsByInternalId2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

				__CreatedDateTimeCondition__ are __mutually inclusive__.
date		☐		Filter on the registration date for the project transaction.
expandNote		☐		Expands project transaction notes
fromPeriod		☐		Mandatory. Start date for the task.
greaterThanValue		☐		Greater than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
module		☐		Select to filter on module; e.g. AR, AP, IN etc. (Values: ModuleGL, ModuleAP, ModuleAR, ModuleCA, ModuleCM, ModuleIN, ModuleSO, ModulePO, ModuleDR, ModuleFA, ModuleEP, ModulePM, ModuleTX, ModuleCR)
project		☐		Filter on project ID.
projectTask		☐		Filter on Task ID.
status		☐		The status of the document. (Values: Hold, Balanced, Released)
toPeriod		☐		Mandatory. End date for the task.

Columns of Table Function

The columns of the table function ProjectTransactionLineEmployeeWorkGroupDescriptions are shown below. Each column has an SQL data type.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
accountGroup_name	varchar2	General Ledger Account Group Name	☐	Click the magnifier. > The name.
accountGroup_number	varchar2	General Ledger Account Group Number	☐	Click the magnifier. > The identifier.
address_addressId	int32	Address ID	☐	
address_addressLine1	varchar2	Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line of the address.
address_addressLine3	varchar2	Address Line 3	☐	Address 3 > The third line of the address.
address_city	varchar2	City	☐	City > The city.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode.
allocated	char	Allocated	☐	Allocated > A check box that indicates w hether the amounts of the transactions w ere allocated for the project.
amount	double	Amount	☐	Amount > The amount of the transaction.
batchNbr	varchar2	Batch Number	☐	Batch no. > The batch number of the transaction in the General ledger w orkspace.
billable	char	Billable	☐	Invoiceable > A check box indicating w hether the transaction is used in calculating the amount charged to the customer for the project task.
billableQuantity	double	Billable Quantity	☐	Qty. that can be invoiced > The total invoiceable quantity for the transactions listed in the table.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
calendarID	varchar2	Calendar ID	☐	
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
contact_contactId	int32	Contact ID	☐	
contact_email	varchar2	Contact Email	☐	Email > The email address of the customer/supplier/company as a business entity.
contact_employeeContact	varchar2	Contact Employee Contact	☐	Employee contact > The link to the contact record associated with the employee.
contact_fax	varchar2	Contact Fax	☐	Fax > The fax number.
contact_firstName	varchar2	Contact First Name	☐	First name > The first name of the employee.
contact_lastName	varchar2	Contact Last Name	☐	Mandatory field: Last name* > The last name of the employee.
contact_midName	varchar2	Contact Middle Name	☐	Middle name > The middle name of the employee.
contact_name	varchar2	Contact Name	☐	Name > The legal name of to appear on the documents.
contact_phone1	varchar2	Contact Phone 1	☐	Phone 1 > The default phone number.
contact_phone2	varchar2	Contact Phone 2	☐	Phone 2 > An additional phone number.
contact_phone3	varchar2	Contact Phone 3	☐	Phone 3 > An additional phone number of the employee.
contact_title	varchar2	Contact Title	☐	Title > The courtesy title to be used for the employee.
contact_web	varchar2	Contact Website	☐	Web > The website of the company, if one exists.
creditAccount_active	char		☐	
creditAccount_description	varchar2		☐	Name of item/description
creditAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
creditAccount_externalCode2	varchar2		☐	Account class > The name of the account class.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
creditAccount_number	varchar2		☐	Number of item
creditAccount_type	varchar2		☐	Account > The account number.
creditAccountGroup_name	varchar2		☐	Click the magnifier. > The name.
creditAccountGroup_number	varchar2		☐	Click the magnifier. > The identifier.
creditSubaccount_active	char		☐	
creditSubaccount_description	varchar2		☐	Click on the magnifier. > The description.
creditSubaccount_id	varchar2		☐	Click on the magnifier. > The identifier.
customerVendor_internalId	int32		☐	
customerVendor_name	varchar2		☐	The name of the particular destination of the selected type.
customerVendor_number	varchar2		☐	The identifier of the particular destination of the selected type.
date	datetime	Date	☐	Date > The date the transaction w as created.
debitAccount_active	char		☐	
debitAccount_description	varchar2		☐	Name of item/description
debitAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
debitAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
debitAccount_number	varchar2		☐	Number of item
debitAccount_type	varchar2		☐	Account > The account number.
debitAccountGroup_name	varchar2		☐	Click the magnifier. > The name.
debitAccountGroup_number	varchar2		☐	Click the magnifier. > The identifier.
debitSubaccount_active	char		☐	
debitSubaccount_description	varchar2		☐	Click on the magnifier. > The description.
debitSubaccount_id	varchar2		☐	Click on the magnifier. > The identifier.
department	varchar2	Department	☐	Mandatory field: General information tab > Employee section > Department* > The department the employee w orks for.
description_2	varchar2	Description 2	☐	The top part > Description > The description provided for the transaction.
description	varchar2	Description	☐	Description > The description of the transaction.
earningType_code	varchar2		☐	Mandatory field: Code* > The unique ID of the type of hour.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
earningType_description	varchar2		☐	Mandatory field: Description > The brief description of the type of hour.
earningType_isActive	char		☐	Active > A check box that indicates (if selected) that the type of hour is active and can be used.
earningType_isBillable	char		☐	Invoicable > A check box that indicates (if selected) that the type is treated as invoiceable by default.
earningType_isOvertime	char		☐	Overtime > A check box that indicates (if selected) that the type of hour is treated as overtime.
earningType_lastModifiedDateTime	datetime		☐	System generated information.
earningType_overtimeMultiplier	double		☐	Multiplier > The value by which the employee cost for this type of hour is multiplied when the time activity is released.
employeeClass_description	varchar2	Employee Class Description	☐	Click on the magnifier. > The description.
employeeClass_id	varchar2	Employee Class ID	☐	Click on the magnifier. > The identifier.
employeeId	int32	Employee ID	☐	Mandatory field: The top part > Employee ID* > The unique identifier, which is assigned to the employee in accordance with the configuration of the EMPLOYEE segmented key.
employeeLogin	varchar2	Employee Login	☐	
employeeName	varchar2	Employee Name	☐	The top part > Employee name > The name of this employee.
employeeNumber	varchar2	Employee Number	☐	General information tab > Employee settings section > Employee ref. no. > A reference number for the employee.
employeeUserId	guid	Employee User ID	☐	Employee internal user ID. This is the ID of the user linked to the employee
endDate	datetime	End Date	☐	End date > The end date for this transaction
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo_3	varchar2		☐	
errorInfo	varchar2	Error Message	☐	
financialPeriod	varchar2	Financial Period	☐	Period > The financial period associated with the transaction.
inventoryId_description	varchar2		☐	Name of item/description
inventoryId_number	varchar2		☐	Number of item
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	System generated information

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
lastModifiedDateTime	datetime	Last Modified	☐	
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize_3	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount_3	int64		☐	
metadata_totalCount	int64	Total Count	☐	
module	varchar2	Module	☐	The top part > Module > The module you create the transactions in.
note_2	varchar2	Note 2	☐	
note	varchar2	Note	☐	
origDocNbr	varchar2	Original Document Number	☐	The top part > Orig. doc. no. > The reference number of the underlying document for the transaction.
origDocType	varchar2	Original Document Type	☐	The top part > Orig. doc. no. > The type of the document the transaction is based on. It has one of the following values: Allocation, Time card, Case, Expense claim, Allocation reversal, Reversal, Credit note.
overtimeMultiplier	double	Overtime Multiplier	☐	Multiplier > The multiplier by which the unit rate is multiplied when the labour cost is calculated.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	Quantity > The quantity for the transaction, such as the number of service hours provided to the customer.
refNbr	varchar2	Reference Number	☐	The top part > Ref. no. > The reference number of the transaction.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
released	char	Released	☐	Released > A check box indicating w hether the transaction has been released.
startDate	datetime	Start Date	☐	Start date > The start date for this transaction.
status_2	varchar2		☐	The top part > Status > The status of the transaction. The follow ing statuses are possible: Balanced, Released.
status	varchar2	Status	☐	Mandatory field: The top part > Status > The status of the employee. The follow ing options are available: Active, On hold, Hold payments, Inactive, One-time.
TEXT	varchar2		☐	
timeStamp_2	blob		☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
tranId	int64		☐	
unitRate	double		☐	Unit rate > The price of the item or the rate of the service.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure used to estimate the quantity for the transaction, such as HOUR or BOX.
useBillableQty	char		☐	Use the quantity that can be invoiced in the amount formula > A check box that you select if you w ant the system to use the invoiceable quantity (the Invoiceable quantity column) instead of the overall quantity (the Quantity column) of the transaction w hen calculating the amount of transaction.

ProjectTransactionLines: Visma.net Financials Project Transaction Lines

Get a range of Project transaction documents - ScreenId=PM304000Data for Project transactions

Catalog: VismaNet

Schema: ProjectTransaction

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Label: Project Transaction Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTransactionLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
billable		☐		Filter invoiceable project tasks.
branch		☐		Filter on branch for the project transation.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
date		☐		Filter on the registration date for the project transaction.
expandNote		☐		Expands project transaction notes

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTransactionLinesByReferenceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ProjectTransactions. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
billable		☐		Filter invoiceable project tasks.
branch		☐		Filter on branch for the project transation.
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:*

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				``yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
date		☐		Filter on the registration date for the project transaction.
expandNote		☐		Expands project transaction notes
fromPeriod		☐		Mandatory. Start date for the task.
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
module		☐		Select to filter on module; e.g. AR, AP, IN etc. (Values: ModuleGL, ModuleAP, ModuleAR, ModuleCA, ModuleCM, ModuleIN, ModuleSO, ModulePO, ModuleDR,

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				ModuleFA, ModuleEP, ModulePM, ModuleTX, ModuleCR)
project		☐		Filter on project ID.
projectTask		☐		Filter on Task ID.
status		☐		The status of the document. (Values: Hold, Balanced, Released)
toPeriod		☐		Mandatory. End date for the task.

Columns of Table Function

The columns of the table function ProjectTransactions are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert and update.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
description	varchar2	Description	☐	The top part > Description > The description provided for the transaction.
errorInfo	varchar2	Error Message	☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
module	varchar2	Module	☐	The top part > Module > The module you create the transactions in.
note	varchar2	Note	☐	
origDocNbr	varchar2	Original Document Number	☐	The top part > Orig. doc. no. > The reference number of the underlying document for the transaction.
origDocType	varchar2	Original Document Type	☐	The top part > Orig. doc. no. > The type of the document the transaction is based on. It has one of the follow ing values: Allocation, Time card, Case, Expense claim, Allocation reversal, Reversal, Credit note.
refNbr	varchar2	Reference Number	☐	The top part > Ref. no. > The reference number of the transaction.
status	varchar2	Status	☐	The top part > Status > The status of the transaction. The follow ing statuses are possible: Balanced, Released.
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent

PurchaseOrderDiscountDetailsByPurchaseOrderNumber

Get a specific Purchase OrderData for a single Purchase Order. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseOrder

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderDiscountDetailsByPurchaseOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
purchaseOrderNumber		☑		Identifies the Purchase Order

Columns of Table Function

The columns of the table function PurchaseOrderDiscountDetailsByPurchaseOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlTotal	double	Total for Control	☐	The top part > Control total > The order's total amount

PurchaseOrderLines: Visma.net Financials Purchase Order Lines

Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: PurchaseOrder

Label: Purchase Order Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter on Branch
deliveryDate		☐		This value indicates the date the document is due for delivery. Use it to retrieve all records that have the delivery date since that time, up to the future.Accepted format:* ```yyyy-MM-dd``` * ```yyyy-MM-dd HH:mm:ss``` * ```yyyy-MM-dd HH:mm:ss.FFF``` * ```yyyy-MM-ddTHH:mm:ss``` * ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.

Columns of Table Function

The columns of the table function PurchaseOrderLines are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	varchar2	Account Description	☐	Name of item/description
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	
alternateId	varchar2	Alternate ID	☐	Alternate ID > The alternate ID used for this stock item-subitem pair by the supplier.
amount	double	Amount	☐	Amount > The amount calculated (after the discount has been taken) for the item.
baseOrderQty	double		☐	Base Order qty. > The base quantity of the item that has been ordered.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
canceled	char	Canceled	☐	Cancelled > A check box that indicates (if selected) that this line of the purchase order has been cancelled.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
completed	char	Completed	☐	Completed > A check box that indicates (if selected) that the purchasing of the item requested by this line of the purchase order has been completed.
completeOn	double		☐	Complete on (%) > The minimum percentage of the ordered quantity for the stock item that must be received to complete the purchase order line (gets the default value from the Threshold receipt (%) setting of the supplier in the (AP303000) w indow).
controlTotal	double	Total for Control	☐	The top part > Control total > The order's total amount (including VAT), w hich you must enter manually w hen you attempt to save the order w ith the Balanced status.
controlTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Control total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
currency	varchar2	Currency	☐	The top part > Currency > The currency the purchase order w ill be paid in.
customDateTimeUTC1_2	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDateTimeUTC1	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDec1_2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec1	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2_2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customInt1_2	int32		☐	A free custom colum of type int
customInt1	int32		☐	A free custom colum of type int
customInt2_2	int32		☐	A free custom colum of type int
customInt2	int32		☐	A free custom colum of type int
customStr1_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr1	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2_2	varchar2		☐	A free custom colum of type string w ith max length 100.

PurchaseOrderLinesByPurchaseOrderNumber

Get a specific Purchase OrderData for a single Purchase Order. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseOrder

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderLinesByPurchaseOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
purchaseOrderNumber		☑		Identifies the Purchase Order

Columns of Table Function

The columns of the table function PurchaseOrderLinesByPurchaseOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	varchar2	Account Description	☐	Name of item/description
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	
alternateId	varchar2	Alternate ID	☐	Alternate ID > The alternate ID used for this stock item-subitem pair by the supplier.
amount	double	Amount	☐	Amount > The amount calculated (after the discount has been taken) for the item.
baseOrderQty	double		☐	Base Order qty. > The base quantity of the item that has been ordered.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
canceled	char	Canceled	☐	Cancelled > A check box that indicates (if selected) that this line of the purchase order has been cancelled.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
completed	char	Completed	☐	Completed > A check box that indicates (if selected) that the purchasing of the item requested by this line of the purchase order has been completed.
completeOn	double		☐	Complete on (%) > The minimum percentage of the ordered quantity for the stock item that must be received to complete the purchase order line (gets the default value from the Threshold receipt (%) setting of the supplier in the (AP303000) w indow).
controlTotal	double	Total for Control	☐	The top part > Control total > The order's total amount (including VAT), w hich you must

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				enter manually w hen you attempt to save the order w ith the Balanced status.
controlTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Control total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
currency	varchar2	Currency	☐	The top part > Currency > The currency the purchase order w ill be paid in.
customDateTimeUTC1_2	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDateTimeUTC1	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDec1_2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec1	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2_2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customInt1_2	int32		☐	A free custom colum of type int
customInt1	int32		☐	A free custom colum of type int
customInt2_2	int32		☐	A free custom colum of type int
customInt2	int32		☐	A free custom colum of type int
customStr1_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr1	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr4_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr4	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5	varchar2		☐	A free custom colum of type string w ith max length 100.

Name	Data Type	Label	Required	Documentation
date	datetime	Date	☐	Mandatory field: The top part > Date* > The date when the purchase order was created.
description	varchar2	Description	☐	The top part > Description > A brief description of the purchase order.
discountAmount	double		☐	Discount amount > If the Supplier customer discounts functionality is enabled in the Enable/disable functionalities (CS100000) window, the amount of the discount that has been specified manually or calculated based on the discount percent entered manually.
discountCode_description	varchar2	Discount Code Description	☐	Name of item/description
discountCode_number	varchar2	Discount Code Number	☐	Number of item
discountPercent	double	Discount Percent	☐	Discount percent > If the Supplier customer discounts functionality is enabled in the Enable/disable functionalities (CS100000) window, the percent of the discount that has been entered manually or calculated based on the discount amount entered manually for this line item.
dontEmail	char	Don't Email	☐	Other information > Do not email > A check box that indicates (if selected) indicates that the purchase order should not be emailed.
dontPrint	char	Don't Print	☐	Other information > Do not print > A check box that indicates (if selected) that the current purchase order should not be printed.
emailed	char	Emailed	☐	Other information > Emailed > A check box that indicates (if selected) indicates that the current purchase order was emailed.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
extCost	double	Extended Cost	☐	Ext. cost > The extended cost of the item, which is the unit cost multiplied by the quantity.
fobPoint	varchar2		☐	Delivery instructions tab > The Delivery instructions section > FOB point > The FOB point where the title of goods (listed on this purchase order) is transferred from the supplier to the company.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
hold	char	Hold	☐	The top part > Hold > A check box that you select to give the purchase order the On hold status.
inventory_description	varchar2	Inventory Description	☐	Name of item/description
inventory_number	varchar2	Inventory Number	☐	Number of item
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineDescription	varchar2	Line Description	☐	A description of the order line, w hich is copied from the item's description.
lineNbr	int32		☐	The line number
lineTotal	double	Line Total	☐	The top part > Line total > The total sum of the Extended amount entries for all lines in the current purchase order. This value is calculated by the system and users cannot manually change it.
lineTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Line total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
lineType	varchar2	Line Type	☐	Line type > The type of the order line, w hich can be one of the follow ing options: Goods for inventory, Non-stock, Service, Freight, Good for sales order, Non-stock for drop-ship, Drop-ship, Goods for RP, Description.
location_id	int32	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
maxReceipt	double		☐	Max. receipt (%) > The maximum quantity of the item, expressed as a percentage of the ordered quantity, that is required for the item to be accepted at the w arehouse if the Receipt action is Rejected.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
minReceipt	double		☐	Min. receipt (%) > The minimum quantity of the item, expressed as a percentage of the ordered quantity, that is

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				required for the item to be accepted at the warehouse if the Receipt action is Rejected.
note_2	varchar2	Note 2	☐	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the document.
note	varchar2	Note	☐	Table > Icon Notes > Pop-up window for providing any user-defined text connected to the order.
openBalance	double	Open Balance	☐	Other information > Open amount > The amount of these items that are ordered but not received.
openQuantity	double		☐	Other information > Open Quantity > The difference between the quantities of ordered and received items.
orderNbr	varchar2	Order Number	☐	The top part > Order no. > The unique reference number of the purchase order, which the system assigns based on the number series assigned to purchase orders of this type, as specified in the PO101000 window.
orderNumber	varchar2	Order Number	☐	Order no. > The reference number of the blanket or standard order (for normal orders based on blanket or standard orders).
orderQty	double	Order Quantity	☐	Order qty. > The quantity of the item that has been ordered.
orderTotal	double	Order Total	☐	The Top part > Order total > The total sum for the purchase order, including VAT. This read-only value is the sum of the Line total and VAT total values.
orderTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Order total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
orderType_2	varchar2		☐	The top part > Type > The type of the purchase order, which can be one of these options: Normal, Drop-ship, Blanket, Default
orderType	varchar2	Order Type	☐	Order type > The order type this order is related to (for normal orders based on blanket or standard orders).

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
owner_id	guid	Owner ID	☐	Click the magnifier > The identifier
owner_name	varchar2	Owner Name	☐	Click the magnifier > The displayed name
paymentRefNbr	varchar2	Payment Reference Number	☐	Other information tab > Prepayment ref. no. > The reference number of the prepayment request linked to this purchase order, if any.
printed	char	Printed	☐	Other information > Printed > A check box that indicates (if selected) that the current purchase order was printed.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
promised	datetime	Promised	☐	Promised > The date when the item's delivery was promised.
promisedOn	datetime	Promised on	☐	The top part > Delivery date > The date when the supplier promised that the items listed in the order will be received at their destination location.
qtyOnReceipts	double		☐	Qty. on receipts > The quantity of the item that has been received according to all receipts, including the unreleased ones.
receiptAction	varchar2		☐	Receipt action > The action that should be performed when the ordered item is received if its quantity is greater than the Max. receipt value or less than the Min. receipt value calculated based on the line's ordered quantity. Values: Reject, Accept but warn, Accept.
receivedAmt	double	Received Amount	☐	Received amt. > The amount received on this purchase order for this item.
remitAddress_addressId	int32		☐	
remitAddress_addressLine1	varchar2		☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
remitAddress_addressLine2	varchar2		☐	Address 2 > The second line of the address.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
remitAddress_addressLine3	varchar2		☐	Address 3 > The third line of the address.
remitAddress_city	varchar2		☐	City > The city.
remitAddress_country_errorInfo	varchar2		☐	
remitAddress_country_id	varchar2		☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
remitAddress_country_metadata_maxPageSize	int64		☐	
remitAddress_country_metadata_totalCount	int64		☐	
remitAddress_country_name	varchar2		☐	Mandatory field: Country name* > The complete name of the country.
remitAddress_county_id	varchar2		☐	Click the magnifier > The identifier
remitAddress_county_name	varchar2		☐	Click the magnifier > The displayed name
remitAddress_overrideAddress	char		☐	The Supplier info tab > The Supplier address section > Override > A check box that you select to override (that is, to edit) the default shipping address for the supplier.
remitAddress_postalCode	varchar2		☐	Postcode > The postcode.
remitContact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
remitContact_contactId	int32		☐	
remitContact_email	varchar2		☐	Email > The email address of the customer/supplier/company as a business entity.
remitContact_fax	varchar2		☐	Fax > The fax number.
remitContact_name	varchar2		☐	Name > The legal name of to appear on the documents.
remitContact_overrideContact	char		☐	The Supplier information tab > The Supplier contact section > Override > A check box that you select to override (edit) the default contact settings for the supplier.
remitContact_phone1	varchar2		☐	Phone 1 > The default phone number.
remitContact_phone2	varchar2		☐	Phone 2 > An additional phone number.
remitContact_w eb	varchar2		☐	Web > The w ebsite of the company, if one exists.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
requested	datetime	Requested	☐	Requested > The date w hen the item w as requested.
requisitionRefNbr	varchar2		☐	Other information tab > Requisition ref. no. > The reference number of the requisition document associated w ith the purchase order, if any.
salesOrderNbr	varchar2		☐	Other information tab > Sales order no. > The ID of the sales order associated w ith the purchase order.
salesOrderType	varchar2		☐	Other information tab > Sales order type > The type of the sales order associated w ith the purchase order.
shippingAddress_addressId	int32		☐	
shippingAddress_addressLine1	varchar2		☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
shippingAddress_addressLine2	varchar2		☐	Address 2 > The second line of the address.
shippingAddress_addressLine3	varchar2		☐	Address 3 > The third line of the address.
shippingAddress_city	varchar2		☐	City > The city.
shippingAddress_country_errorInfo	varchar2		☐	
shippingAddress_country_id	varchar2		☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.

Name	Data Type	Label	Required	Documentation
warehouse_id	varchar2	Warehouse ID	☐	Click on the magnifier. > The identifier.
workgroupID	int32		☐	Other information tab > Work group ID > The work group to which the purchase order was assigned for processing.

PurchaseOrderLineSubsegments: Visma.net Financials Purchase Order Line Subsegments

Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: PurchaseOrder

Label: Purchase Order Line Subsegments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderLineSubsegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter on Branch
deliveryDate		☐		This value indicates the date the document is due for delivery. Use it to retrieve all records that have the delivery date since that time, up to the future.Accepted format:* ```yyyy-MM-dd``` * ```yyyy-MM-dd HH:mm:ss``` * ```yyyy-MM-dd HH:mm:ss.FFF``` * ```yyyy-MM-ddTHH:mm:ss``` * ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_

Name	Data Type	Label	Required	Documentation
orderNumber	varchar2	Order Number	☐	Order no. > The reference number of the blanket or standard order (for normal orders based on blanket or standard orders).
orderQty	double	Order Quantity	☐	Order qty. > The quantity of the item that has been ordered.
orderTotal	double	Order Total	☐	The Top part > Order total > The total sum for the purchase order, including VAT. This read-only value is the sum of the Line total and VAT total values.
orderTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Order total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
orderType_2	varchar2		☐	The top part > Type > The type of the purchase order, which can be one of these options: Normal, Drop-ship, Blanket, Default
orderType	varchar2	Order Type	☐	Order type > The order type this order is related to (for normal orders based on blanket or standard orders).
owner_id	guid	Owner ID	☐	Click the magnifier > The identifier
owner_name	varchar2	Owner Name	☐	Click the magnifier > The displayed name
paymentRefNbr	varchar2	Payment Reference Number	☐	Other information tab > Prepayment ref. no. > The reference number of the prepayment request linked to this purchase order, if any.
printed	char	Printed	☐	Other information > Printed > A check box that indicates (if selected) that the current purchase order was printed.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
promised	datetime	Promised	☐	Promised > The date when the item's deliver was promised.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
promisedOn	datetime	Promised on	☐	The top part > Delivery date > The date w hen the supplier promised that the items listed in the order w ill be received at their destination location.
qtyOnReceipts	double		☐	Qty. on receipts > The quantity of the item that has been received according to all receipts, including the unreleased ones.
receiptAction	varchar2		☐	Receipt action > The action that should be perform w hen the ordered item is received if its quantity is greater than the Max. receipt value or less than the Min. receipt value calculated based on the line's ordered quantity. Values: Reject, Accept but w arn, Accept.
receivedAmt	double	Received Amount	☐	Received amt. > The amount received on this purchase order for this item.
remitAddress_addressId	int32		☐	
remitAddress_addressLine1	varchar2		☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
remitAddress_addressLine2	varchar2		☐	Address 2 > The second line of the address.
remitAddress_addressLine3	varchar2		☐	Address 3 > The third line of the address.
remitAddress_city	varchar2		☐	City > The city.
remitAddress_country_errorInfo	varchar2		☐	
remitAddress_country_id	varchar2		☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
remitAddress_country_metadata_ maxPageSize	int64		☐	
remitAddress_country_metadata_t otalCount	int64		☐	
remitAddress_country_name	varchar2		☐	Mandatory field: Country name* > The complete name of the country.
remitAddress_county_id	varchar2		☐	Click the magnifier > The identifier
remitAddress_county_name	varchar2		☐	Click the magnifier > The displayed name
remitAddress_overrideAddress	char		☐	The Supplier info tab > The Supplier address section > Override > A check box that you select to override (that is, to edit) the default shipping address for the supplier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
remitAddress_postalCode	varchar2		☐	Postcode > The postcode.
remitContact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
remitContact_contactId	int32		☐	
remitContact_email	varchar2		☐	Email > The email address of the customer/supplier/company as a business entity.
remitContact_fax	varchar2		☐	Fax > The fax number.
remitContact_name	varchar2		☐	Name > The legal name of to appear on the documents.
remitContact_overrideContact	char		☐	The Supplier information tab > The Supplier contact section > Override > A check box that you select to override (edit) the default contact settings for the supplier.
remitContact_phone1	varchar2		☐	Phone 1 > The default phone number.
remitContact_phone2	varchar2		☐	Phone 2 > An additional phone number.
remitContact_web	varchar2		☐	Web > The website of the company, if one exists.
requested	datetime	Requested	☐	Requested > The date when the item was requested.
requisitionRefNbr	varchar2		☐	Other information tab > Requisition ref. no. > The reference number of the requisition document associated with the purchase order, if any.
salesOrderNbr	varchar2		☐	Other information tab > Sales order no. > The ID of the sales order associated with the purchase order.
salesOrderType	varchar2		☐	Other information tab > Sales order type > The type of the sales order associated with the purchase order.
segmentDescription	varchar2		☐	The Segment values window > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values window > The Top part > The ID of the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values window > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values window > The table > The

Name	Data Type	Label	Required	Documentation
				Override > A check box that you select to override (edit) the default contact settings for the supplier.
shippingContact_phone1	varchar2		☐	Phone 1 > The default phone number.
shippingContact_phone2	varchar2		☐	Phone 2 > An additional phone number.
shippingContact_w eb	varchar2		☐	Web > The w ebsite of the company, if one exists.
shippingDestinationType	varchar2		☐	Shipping instructions tab > The Delivery address section > Shipping destination type > The type of the shipping destination, w hich is one of the follow ing options: Branch location (meaning a branch of your company), Customer, Supplier, and Warehouse.
shippingLocation_id	int32	Shipping Location ID	☐	Click the magnifier > The identifier
shippingLocation_name	varchar2	Shipping Location Name	☐	Click the magnifier > The displayed name
shipTerms	varchar2		☐	Delivery instructions tab > The Delivery instructions section > Shipping terms > The shipping terms for the purchase order.
shipTo_internalId	int32		☐	
shipTo_name	varchar2		☐	The name of the particular destination of the selected type.
shipTo_number	varchar2		☐	The identifier of the particular destination of the selected type.
shipVia	varchar2	Ship Via	☐	Delivery instructions tab > The Delivery instructions section > Ship via > The carrier selected to ship the goods for the purchase order.
status	varchar2	Status	☐	The top part > Status > The system-generated status of the purchase order, w hich can be one of the follow ing options: On hold, Open, Pending approval, Rejected, Pending printing, Pending e-mail, Closed, Cancelled.
subaccountId	int32		☐	SubID > The identifier of the subaccount.
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
supplier_internalId	int32	Supplier Internal ID	☐	
supplier_name	varchar2	Supplier Name	☐	The name of the particular destination of the selected type.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplier_number	varchar2	Supplier Number	☐	The identifier of the particular destination of the selected type.
supplierRef	varchar2	Supplier Reference	☐	The top part > Supplier ref. > The reference number of the supplier document related to this purchase order.
supplierVatZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierVatZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierVatZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierVatZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierVatZone_errorInfo	varchar2		☐	
supplierVatZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierVatZone_metadata_maxPageSize	int64		☐	
supplierVatZone_metadata_totalCount	int64		☐	
taxCategory_description	varchar2		☐	Name of item/description
taxCategory_number	varchar2		☐	Number of item
taxTotal	double	Tax Total	☐	The Top part > VAT total > The total VAT amount for all lines added to the current purchase order. This value, also calculated by the system, is the sum of the VAT amounts for each line.
taxTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the VAT total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
terms_description	varchar2	Terms Description	☐	Click on the magnifier. > The description.
terms_id	varchar2	Terms ID	☐	Click on the magnifier. > The identifier.
timeStamp_2	blob		☐	
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
unitCost	double	Unit Cost	☐	Unit cost > The cost per UoM of the stock item.
unitCostInBaseCurrency	double		☐	Background calculation connected with the View base/View currency function in the top part. Changes the values in Unit cost, Amount, Disc. unit cost and Cost fields.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure (UoM) in which the quantity of the item is specified.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the VAT with the Include in VAT exempt total check box selected in the TX205000 window.
vatExemptTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the VAT exempt total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
warehouse_description_2	varchar2		☐	Click on the magnifier. > The description.
warehouse_description	varchar2	Warehouse Description	☐	Click on the magnifier. > The description.
warehouse_id_2	varchar2		☐	Click on the magnifier. > The identifier.
warehouse_id	varchar2	Warehouse ID	☐	Click on the magnifier. > The identifier.
workgroupID	int32		☐	Other information tab > Work group ID > The work group to which the purchase order was assigned for processing.

PurchaseOrderOrderBypurchaseOrderNumber_LinesSubSegments

Get a specific Purchase OrderData for a single Purchase Order. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseOrder

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function PurchaseOrderOrderBypurchaseOrderNumber_LinesSubSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
purchaseOrderNumber		☑		Identifies the Purchase Order

Columns of Table Function

The columns of the table function PurchaseOrderOrderBypurchaseOrderNumber_LinesSubSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	varchar2	Account Description	☐	Name of item/description
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	
active	char	Active	☐	Active > The status of the identifier.
alternateId	varchar2	Alternate ID	☐	Alternate ID > The alternate ID used for this stock item-subitem pair by the supplier.
amount	double	Amount	☐	Amount > The amount calculated (after the discount has been taken) for the item.
baseOrderQty	double		☐	Base Order qty. > The base quantity of the item that has been ordered.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.

warehouse_id_2	varchar2		☐	Click on the magnifier. > The identifier.
warehouse_id	varchar2	Warehouse ID	☐	Click on the magnifier. > The identifier.
workgroupID	int32		☐	Other information tab > Work group ID > The work group to which the purchase order was assigned for processing.

PurchaseOrderReceipts: Visma.net Financials Purchase Order Receipts

Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: PurchaseOrder

Label: Purchase Order Receipts

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderReceipts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter on Branch
deliveryDate		☐		This value indicates the date the document is due for delivery. Use it to retrieve all records that have the delivery date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.
deliveryDateCondition		☐		This value represents the condition to be applied to the Due Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.
greaterThanValue		☐		Filter on order no. and forw ard
includeCustomFreeFields		☐		Parameter to include custom free fields information in the result set, if true then custom free fields w ill be included in the result set
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
				to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.

				w hich the purchase order w as assigned for processing.

PurchaseOrderReceiptsByPurchaseOrderNumber

Get a specific Purchase OrderData for a single Purchase Order. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseOrder

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderReceiptsByPurchaseOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
purchaseOrderNumber		☑		Identifies the Purchase Order

Columns of Table Function

The columns of the table function PurchaseOrderReceiptsByPurchaseOrderNumber are shown below. Each column has an SQL data type.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrders. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

orderType		☐		Select and filter on Type. (Values: RegularOrder, DropShip, Blanket, StandardBlanket)
supplier		☐		Filter on Supplier.

Columns of Table Function

The columns of the table function PurchaseOrders are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

Name	Data Type	Label	Required	Documentation
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlTotal	double	Total for Control	☐	The top part > Control total > The order's total amount (including VAT), w hich you must enter manually w hen you attempt to save the order w ith the Balanced status.
controlTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Control total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
currency	varchar2	Currency	☐	The top part > Currency > The currency the purchase order w ill be paid in.
customDateTimeUTC1	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDec1	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customInt1	int32		☐	A free custom colum of type int
customInt2	int32		☐	A free custom colum of type int
customStr1	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3	varchar2		☐	A free custom colum of type string w ith max length 100.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customStr4	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5	varchar2		☐	A free custom colum of type string w ith max length 100.
date	datetime	Date	☐	Mandatory field: The top part > Date* > The date w hen the purchase order w as created.
description	varchar2	Description	☐	The top part > Description > A brief description of the purchase order.
dontEmail	char	Don't Email	☐	Other information > Do not email > A check box that indicates (if selected) indicates that the purchase order should not be emailed.
dontPrint	char	Don't Print	☐	Other information > Do not print > A check box that indicates (if selected) that the current purchase order should not be printed.
emailed	char	Emailed	☐	Other information > Emailed > A check box that indicates (if selected) indicates that the current purchase order w as emailed.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
fobPoint	varchar2		☐	Delivery instructions tab > The Delivery instructions section > FOB point > The FOB point w here the title of goods (listed on this purchase order) is transferred from the supplier to the company.
hold	char	Hold	☐	The top part > Hold > A check box that you select to give the purchase order the On hold status.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineTotal	double	Line Total	☐	The top part > Line total > The total sum of the Extended amount entries for all lines in the current purchase order. This value is calculated by the system and users cannot manually change it.
lineTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Line total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
location_id	int32	Location ID	☐	Click the magnifier > The identifier

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note	varchar2	Note	☐	Icon Notes on top of the w indow > Pop-up w indow for providing any user-defined text connected to the document.
openBalance	double	Open Balance	☐	Other information > Open amount > The amount of these items that are ordered but not received.
openQuantity	double		☐	Other information > Open Quantity > The difference betw een the quantities of ordered and received items.
orderNbr	varchar2	Order Number	☐	The top part > Order no. > The unique reference number of the purchase order, w hich the system assigns based on the number series assigned to purchase orders of this type, as specified in the PO101000 w indow .
orderTotal	double	Order Total	☐	The Top part > Order total > The total sum for the purchase order, including VAT. This read-only value is the sum of the Line total and VAT total values.
orderTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Order total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
orderType	varchar2	Order Type	☐	The top part > Type > The type of the purchase order, w hich can be one of these options: Normal, Drop-ship, Blanket, Default
ow ner_id	guid	Ow ner ID	☐	Click the magnifier > The identifier
ow ner_name	varchar2	Ow ner Name	☐	Click the magnifier > The displayed name
paymentRefNbr	varchar2	Payment Reference Number	☐	Other information tab > Prepayment ref. no. > The reference number of the prepayment request linked to this purchase order, if any.
printed	char	Printed	☐	Other information > Printed > A check box that indicates (if selected) that the current purchase order w as printed.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
promisedOn	datetime	Promised on	☐	The top part > Delivery date > The date w hen the supplier promised that the items listed in the order w ill be received at their destination location.
remitAddress_addressId	int32		☐	
remitAddress_addressLine1	varchar2		☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
remitAddress_addressLine2	varchar2		☐	Address 2 > The second line of the address.
remitAddress_addressLine3	varchar2		☐	Address 3 > The third line of the address.
remitAddress_city	varchar2		☐	City > The city.
remitAddress_country_errorInfo	varchar2		☐	
remitAddress_country_id	varchar2		☐	Mandatory field: Country ID* > The unique tw o-letter country ID according to international standard ISO 3166.
remitAddress_country_metadata_ maxPageSize	int64		☐	
remitAddress_country_metadata_t otalCount	int64		☐	
remitAddress_country_name	varchar2		☐	Mandatory field: Country name* > The complete name of the country.
remitAddress_county_id	varchar2		☐	Click the magnifier > The identifier
remitAddress_county_name	varchar2		☐	Click the magnifier > The displayed name
remitAddress_overrideAddress	char		☐	The Supplier info tab > The Supplier address section > Override > A check box that you select to override (that is, to edit) the default shipping address for the supplier.
remitAddress_postalCode	varchar2		☐	Postcode > The postcode.
remitContact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
remitContact_contactId	int32		☐	
remitContact_email	varchar2		☐	Email > The email address of the customer/supplier/company as a business entity.
remitContact_fax	varchar2		☐	Fax > The fax number.
remitContact_name	varchar2		☐	Name > The legal name of to appear on the documents.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
remitContact_overrideContact	char		☐	The Supplier information tab > The Supplier contact section > Override > A check box that you select to override (edit) the default contact settings for the supplier.
remitContact_phone1	varchar2		☐	Phone 1 > The default phone number.
remitContact_phone2	varchar2		☐	Phone 2 > An additional phone number.
remitContact_web	varchar2		☐	Web > The website of the company, if one exists.
requisitionRefNbr	varchar2		☐	Other information tab > Requisition ref. no. > The reference number of the requisition document associated with the purchase order, if any.
salesOrderNbr	varchar2		☐	Other information tab > Sales order no. > The ID of the sales order associated with the purchase order.
salesOrderType	varchar2		☐	Other information tab > Sales order type > The type of the sales order associated with the purchase order.
shippingAddress_addressId	int32		☐	
shippingAddress_addressLine1	varchar2		☐	Address 1 > The first line of the customer's/supplier's/company's/employee's contact address.
shippingAddress_addressLine2	varchar2		☐	Address 2 > The second line of the address.
shippingAddress_addressLine3	varchar2		☐	Address 3 > The third line of the address.
shippingAddress_city	varchar2		☐	City > The city.
shippingAddress_country_errorInfo	varchar2		☐	
shippingAddress_country_id	varchar2		☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
shippingAddress_country_metadata_maxPageSize	int64		☐	
shippingAddress_country_metadata_totalCount	int64		☐	
shippingAddress_country_name	varchar2		☐	Mandatory field: Country name* > The complete name of the country.
shippingAddress_county_id	varchar2		☐	Click the magnifier > The identifier
shippingAddress_county_name	varchar2		☐	Click the magnifier > The displayed name

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
shippingAddress_overrideAddress	char		☐	The Supplier info tab > The Supplier address section > Override > A check box that you select to override (that is, to edit) the default shipping address for the supplier.
shippingAddress_postalCode	varchar2		☐	Postcode > The postcode.
shippingContact_attention	varchar2		☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
shippingContact_contactId	int32		☐	
shippingContact_email	varchar2		☐	Email > The email address of the customer/supplier/company as a business entity.
shippingContact_fax	varchar2		☐	Fax > The fax number.
shippingContact_name	varchar2		☐	Name > The legal name of to appear on the documents.
shippingContact_overrideContact	char		☐	The Supplier information tab > The Supplier contact section > Override > A check box that you select to override (edit) the default contact settings for the supplier.
shippingContact_phone1	varchar2		☐	Phone 1 > The default phone number.
shippingContact_phone2	varchar2		☐	Phone 2 > An additional phone number.
shippingContact_web	varchar2		☐	Web > The website of the company, if one exists.
shippingDestinationType	varchar2		☐	Shipping instructions tab > The Delivery address section > Shipping destination type > The type of the shipping destination, which is one of the following options: Branch location (meaning a branch of your company), Customer, Supplier, and Warehouse.
shippingLocation_id	int32	Shipping Location ID	☐	Click the magnifier > The identifier
shippingLocation_name	varchar2	Shipping Location Name	☐	Click the magnifier > The displayed name
shipTerms	varchar2		☐	Delivery instructions tab > The Delivery instructions section > Shipping terms > The shipping terms for the purchase order.
shipTo_internalId	int32		☐	
shipTo_name	varchar2		☐	The name of the particular destination of the selected type.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
shipTo_number	varchar2		☐	The identifier of the particular destination of the selected type.
shipVia	varchar2	Ship Via	☐	Delivery instructions tab > The Delivery instructions section > Ship via > The carrier selected to ship the goods for the purchase order.
status	varchar2	Status	☐	The top part > Status > The system-generated status of the purchase order, which can be one of the following options: On hold, Open, Pending approval, Rejected, Pending printing, Pending e-mail, Closed, Cancelled.
supplier_internalId	int32	Supplier Internal ID	☐	
supplier_name	varchar2	Supplier Name	☐	The name of the particular destination of the selected type.
supplier_number	varchar2	Supplier Number	☐	The identifier of the particular destination of the selected type.
supplierRef	varchar2	Supplier Reference	☐	The top part > Supplier ref. > The reference number of the supplier document related to this purchase order.
supplierVatZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierVatZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierVatZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierVatZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierVatZone_errorInfo	varchar2		☐	
supplierVatZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierVatZone_metadata_maxPageSize	int64		☐	
supplierVatZone_metadata_totalCount	int64		☐	
taxTotal	double	Tax Total	☐	The Top part > VAT total > The total VAT amount for all lines added to the current purchase order. This value, also calculated by the system, is the sum of the VAT amounts for each line.
taxTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the VAT total to your base currency

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
terms_description	varchar2	Terms Description	☐	Click on the magnifier. > The description.
terms_id	varchar2	Terms ID	☐	Click on the magnifier. > The identifier.
timeStamp	blob	Timestamp	☐	
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the VAT with the Include in VAT exempt total check box selected in the TX205000 window.
vatExemptTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the VAT exempt total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
warehouse_description	varchar2	Warehouse Description	☐	Click on the magnifier. > The description.
warehouse_id	varchar2	Warehouse ID	☐	Click on the magnifier. > The identifier.
workgroupID	int32		☐	Other information tab > Work group ID > The work group to which the purchase order was assigned for processing.

PurchaseOrderTaxDetails: Visma.net Financials Purchase Order Tax Details

Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: PurchaseOrder

Label: Purchase Order Tax Details

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function PurchaseOrderTaxDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter on Branch
deliveryDate		☐		This value indicates the date the document is due for delivery. Use it to retrieve all records that have the delivery date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.
deliveryDateCondition		☐		This value represents the condition to be applied to the Due Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.
greaterThanValue		☐		Filter on order no. and forw ard
includeCustomFreeFields		☐		Parameter to include custom free fields information in the result set, if true then custom free fields w ill be included in the result set
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_

PurchaseOrderTaxDetailsByPurchaseOrderNumber

Get a specific Purchase OrderData for a single Purchase Order. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseOrder

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function PurchaseOrderTaxDetailsByPurchaseOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
purchaseOrderNumber		☑		Identifies the Purchase Order

Columns of Table Function

The columns of the table function PurchaseOrderTaxDetailsByPurchaseOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
controlTotal	double	Total for Control	☐	The top part > Control total > The order's total amount (including VAT), w hich you must enter manually w hen you attempt to save the order w ith the Balanced status.
controlTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Control total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
currency	varchar2	Currency	☐	The top part > Currency > The currency the purchase order w ill be paid in.
customDateTimeUTC1	datetime		☐	A free custom colum of type DateTime - in UTC timezone

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customDec1	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customInt1	int32		☐	A free custom colum of type int
customInt2	int32		☐	A free custom colum of type int
customStr1	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr4	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5	varchar2		☐	A free custom colum of type string w ith max length 100.
date	datetime	Date	☐	Mandatory field: The top part > Date* > The date w hen the purchase order w as created.
description	varchar2	Description	☐	The top part > Description > A brief description of the purchase order.
dontEmail	char	Don't Email	☐	Other information > Do not email > A check box that indicates (if selected) indicates that the purchase order should not be emailed.
dontPrint	char	Don't Print	☐	Other information > Do not print > A check box that indicates (if selected) that the current purchase order should not be printed.
emailed	char	Emailed	☐	Other information > Emailed > A check box that indicates (if selected) indicates that the current purchase order w as emailed.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
expenseAmount	double		☐	Expense Amount for the VAT type that has been added.
fobPoint	varchar2		☐	Delivery instructions tab > The Delivery instructions section > FOB point > The FOB point w here the title of goods (listed on this purchase order) is transferred from the supplier to the company.
hold	char	Hold	☐	The top part > Hold > A check box that you select to give the purchase order the On hold status.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.

BasicPurchaseOrderReceipts: Visma.net Financials Basic Purchase Order Receipts

Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: PurchaseOrderBasic

Label: Basic Purchase Order Receipts

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicPurchaseOrderReceipts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicPurchaseOrders. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

PurchaseOrderBasicByNumber

Get a specific Purchase OrderData for a single Purchase Order Basic. The response headers include an ETag after a successful GET operation.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Catalog: VismaNet

Schema: PurchaseOrderBasic

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderBasicByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderLinesBasicByPurchaseOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.

Name	Data Type	Required	Default Value	Documentation
purchaseOrderNumber		☑		Identifies the Purchase Order

Columns of Table Function

The columns of the table function PurchaseOrderLinesBasicByPurchaseOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	varchar2	Account Description	☐	Name of item/description
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	
alternateId	varchar2	Alternate ID	☐	Alternate ID > The alternate ID used for this stock item-subitem pair by the supplier.
amount	double	Amount	☐	Amount > The amount calculated (after the discount has been taken) for the item.
baseOrderQty	double		☐	Base Order qty. > The base quantity of the item that has been ordered.
branch_name_2	varchar2	Branch Name 2	☐	Click the magnifier. > The name.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
canceled	char	Canceled	☐	Cancelled > A check box that indicates (if selected) that this line of the purchase order has been cancelled.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
completed	char	Completed	☐	Completed > A check box that indicates (if selected) that the purchasing of the item requested by this line of the purchase order has been completed.
completeOn	double		☐	Complete on (%) > The minimum percentage of the ordered quantity for the stock item that must be received to complete the purchase order line (gets the default value from the Threshold receipt (%) setting of the supplier in the (AP303000) w indow).
controlTotal	double	Total for Control	☐	The top part > Control total > The order's total amount (including VAT), w hich you must

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				enter manually w hen you attempt to save the order w ith the Balanced status.
controlTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Control total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
currency	varchar2	Currency	☐	The top part > Currency > The currency the purchase order w ill be paid in.
customDateTimeUTC1_2	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDateTimeUTC1	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDec1_2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec1	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2_2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customInt1_2	int32		☐	A free custom colum of type int
customInt1	int32		☐	A free custom colum of type int
customInt2_2	int32		☐	A free custom colum of type int
customInt2	int32		☐	A free custom colum of type int
customStr1_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr1	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr4_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr4	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5_2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5	varchar2		☐	A free custom colum of type string w ith max length 100.

Name	Data Type	Label	Required	Documentation
date	datetime	Date	☐	Mandatory field: The top part > Date* > The date when the purchase order was created.
description	varchar2	Description	☐	The top part > Description > A brief description of the purchase order.
discountAmount	double		☐	Discount amount > If the Supplier customer discounts functionality is enabled in the Enable/disable functionalities (CS100000) window, the amount of the discount that has been specified manually or calculated based on the discount percent entered manually.
discountCode_description	varchar2	Discount Code Description	☐	Name of item/description
discountCode_number	varchar2	Discount Code Number	☐	Number of item
discountPercent	double	Discount Percent	☐	Discount percent > If the Supplier customer discounts functionality is enabled in the Enable/disable functionalities (CS100000) window, the percent of the discount that has been entered manually or calculated based on the discount amount entered manually for this line item.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
extCost	double	Extended Cost	☐	Ext. cost > The extended cost of the item, which is the unit cost multiplied by the quantity.
hold	char	Hold	☐	The top part > Hold > A check box that you select to give the purchase order the On hold status.
inventory_description	varchar2	Inventory Description	☐	Name of item/description
inventory_number	varchar2	Inventory Number	☐	Number of item
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineDescription	varchar2	Line Description	☐	A description of the order line, which is copied from the item's description.
lineNbr	int32		☐	The line number
lineTotal	double	Line Total	☐	The top part > Line total > The total sum of the Extended amount entries for all lines in the current purchase order. This value is calculated by the system and users cannot manually change it.
lineTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Line total to your base currency if the amount on the purchase

Name	Data Type	Label	Required	Documentation
				order is in another currency then base currency. When you click the button, the button toggles to View currency.
lineType	varchar2	Line Type	☐	Line type > The type of the order line, which can be one of the following options: Goods for inventory, Non-stock, Service, Freight, Good for sales order, Non-stock for drop-ship, Drop-ship, Goods for RP, Description.
location_id	int32	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
maxReceipt	double		☐	Max. receipt (%) > The maximum quantity of the item, expressed as a percentage of the ordered quantity, that is required for the item to be accepted at the warehouse if the Receipt action is Rejected.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
minReceipt	double		☐	Min. receipt (%) > The minimum quantity of the item, expressed as a percentage of the ordered quantity, that is required for the item to be accepted at the warehouse if the Receipt action is Rejected.
note_2	varchar2	Note 2	☐	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the document.
note	varchar2	Note	☐	Table > Icon Notes > Pop-up window for providing any user-defined text connected to the order.
orderNbr	varchar2	Order Number	☐	The top part > Order no. > The unique reference number of the purchase order, which the system assigns based on the number series assigned to purchase orders of this type, as specified in the PO101000 window.
orderNumber	varchar2	Order Number	☐	Order no. > The reference number of the blanket or standard order (for normal orders based on blanket or standard orders).

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
orderQty	double	Order Quantity	☐	Order qty. > The quantity of the item that has been ordered.
orderTotal	double	Order Total	☐	The Top part > Order total > The total sum for the purchase order, including VAT. This read-only value is the sum of the Line total and VAT total values.
orderTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the Order total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
orderType_2	varchar2		☐	The top part > Type > The type of the purchase order, which can be one of these options: Normal, Drop-ship, Blanket, Default
orderType	varchar2	Order Type	☐	Order type > The order type this order is related to (for normal orders based on blanket or standard orders).
owner_id	guid	Owner ID	☐	Click the magnifier > The identifier
owner_name	varchar2	Owner Name	☐	Click the magnifier > The displayed name
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
promised	datetime	Promised	☐	Promised > The date when the item's deliver was promised.
promisedOn	datetime	Promised on	☐	The top part > Delivery date > The date when the supplier promised that the items listed in the order will be received at their destination location.
qtyOnReceipts	double		☐	Qty. on receipts > The quantity of the item that has been received according to all receipts, including the unreleased ones.
receiptAction	varchar2		☐	Receipt action > The action that should be perform when the ordered item is received if its quantity is greater than the Max. receipt value or less than the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				Min. receipt value calculated based on the line's ordered quantity. Values: Reject, Accept but w arn, Accept.
receivedAmt	double	Received Amount	☐	Received amt. > The amount received on this purchase order for this item.
requested	datetime	Requested	☐	Requested > The date w hen the item w as requested.
status	varchar2	Status	☐	The top part > Status > The system-generated status of the purchase order, w hich can be one of the follow ing options: On hold, Open, Pending approval, Rejected, Pending printing, Pending e-mail, Closed, Cancelled.
sub_active	char		☐	Active > The status of the identifier.
sub_description	varchar2		☐	Description > The description of the identifier.
sub_errorInfo	varchar2		☐	
sub_lastModifiedDateTime	datetime		☐	System generated information.
sub_metadata_maxPageSize	int64		☐	
sub_metadata_totalCount	int64		☐	
sub_subaccountId	int32		☐	SubID > The identifier of the subaccount.
sub_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
sub_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
supplier_internalId	int32	Supplier Internal ID	☐	
supplier_name	varchar2	Supplier Name	☐	The name of the particular destination of the selected type.
supplier_number	varchar2	Supplier Number	☐	The identifier of the particular destination of the selected type.
supplierRef	varchar2	Supplier Reference	☐	The top part > Supplier ref. > The reference number of the supplier document related to this purchase order.
taxCategory_description	varchar2		☐	Name of item/description
taxCategory_number	varchar2		☐	Number of item
taxTotal	double	Tax Total	☐	The Top part > VAT total > The total VAT amount for all lines added to the current purchase order. This value, also calculated by the system, is the sum of the VAT amounts for each line.
taxTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				VAT total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
timeStamp	blob	Timestamp	☐	
unitCost	double	Unit Cost	☐	Unit cost > The cost per UoM of the stock item.
unitCostInBaseCurrency	double		☐	Background calculation connected with the View base/View currency function in the top part. Changes the values in Unit cost, Amount, Disc. unit cost and Cost fields.
uom	varchar2	Unit of Measure	☐	UoM > The unit of measure (UoM) in which the quantity of the item is specified.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT. This total is calculated as the taxable amount for the VAT with the Include in VAT exempt total check box selected in the TX205000 window.
vatExemptTotalInBaseCurrency	double		☐	The top part > View base > A button that recalculates the VAT exempt total to your base currency if the amount on the purchase order is in another currency then base currency. When you click the button, the button toggles to View currency.
warehouse_description	varchar2	Warehouse Description	☐	Click on the magnifier. > The description.
warehouse_id	varchar2	Warehouse ID	☐	Click on the magnifier. > The identifier.

PurchaseOrderLinesSubsegments: Visma.net Financials Purchase Order Lines Subsegments

Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: PurchaseOrderBasic

Label: Purchase Order Lines Subsegments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseOrderLinesSubsegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Filter on Branch
deliveryDate		☐		This value indicates the date the document is due for delivery. Use it to retrieve all records that have the delivery date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.
deliveryDateCondition		☐		This value represents the condition to be applied to the Due Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DeliveryDate__ and __DeliveryDateCondition__ are __mutually inclusive__.
greaterThanValue		☐		Filter on order no. and forw ard
includeCustomFreeFields		☐		Parameter to include custom free fields information in the result set, if true then custom free fields w ill be included in the result set
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd

Label: Basic Purchase Receipt Landed Costs

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicPurchaseReceiptLandCosts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

BasicPurchaseReceiptLines: Visma.net Financials Basic Purchase Receipt Lines

Get a range of Purchase Receipts - ScreenId=PO302000Please use a page size lower or equal to the allowed max page size which is 500

Catalog: VismaNet

Schema: PurchaseReceipt

Label: Basic Purchase Receipt Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicPurchaseReceiptLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

BasicPurchaseReceiptLinesAllocationsByReceiptNumber: Visma.net Financials Basic Purchase Receipt Line Allocations by Receipt Number

Get a specific Purchase ReceiptData for a single Purchase Receipt. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseReceipt

Label: Basic Purchase Receipt Line Allocations by Receipt Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicPurchaseReceiptLinesAllocationsByReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

PurchaseReceiptPurchaseReceiptBasicByreceiptNumber

Get a specific Purchase ReceiptData for a single Purchase Receipt. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseReceipt

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseReceiptPurchaseReceiptBasicByreceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
receiptNumber		☑		Identifies the Purchase Receipt

PurchaseReceiptLineAllocationsBasicByReceiptNumber

Get a specific Purchase ReceiptData for a single Purchase Receipt Basic. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseReceiptBasic

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseReceiptLineAllocationsBasicByReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

3.1.82.1 Tables

PurchaseReceiptLandedCostsV2

Get a range of Purchase Receipts - ScreenId=PO302000Please use a page size lower or equal to the allowed max page size which is 500

Catalog: VismaNet

Schema: PurchaseReceiptV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseReceiptLandedCostsV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

PurchaseReceiptLineAllocationsV2ByReceiptNumber

Get a specific Purchase ReceiptData for a single Purchase Receipt. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseReceiptV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseReceiptLineAllocationsV2ByReceiptNumber. A value must be provided at all times

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
receiptNumber		☑		Identifies the Purchase Receipt

Columns of Table Function

The columns of the table function PurchaseReceiptLineAllocationsV2ByReceiptNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_description	varchar2	Account Description	☐	Name of item/description

PurchaseReceiptLinesV2ByReceiptNumber

Get a specific Purchase ReceiptData for a single Purchase Receipt. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: PurchaseReceiptV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseReceiptLinesV2ByReceiptNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

PurchaseReceiptV2Receipts

Get a range of Purchase Receipts - ScreenId=PO302000Please use a page size lower or equal to the allowed max page size which is 500

Catalog: VismaNet

Schema: PurchaseReceiptV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function PurchaseReceiptV2Receipts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
branch		☐		
dueDate		☐		This value indicates the date the document is due. Use it to retrieve all records that have the due date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __DueDate__ and __DueDateCondition__ are __mutually inclusive__.

SalesCategoryItemAttributesByCategoryId: Visma.net Financials Sales Category Item Attributes by Category ID

Get a range of Inventory Items from a specific Sales Category

Catalog: VismaNet

Schema: SalesCategory

Label: Sales Category Item Attributes by Category ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesCategoryItemAttributesByCategoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesCategoryItemClassAttributesByCategoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SalesCategoryItemInventoryUnitItemClassAttributeDetailsByCategoryId

Get a range of Inventory Items from a specific Sales Category

Catalog: VismaNet

Schema: SalesCategory

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesCategoryItemInventoryUnitItemClassAttributeDetailsByCategoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SalesCategoryItemInventoryUnitsByCategoryId: Visma.net Financials Sales Category Item Inventory Units by Category ID

Get a range of Inventory Items from a specific Sales Category

Catalog: VismaNet

Schema: SalesCategory

Label: Sales Category Item Inventory Units by Category ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesCategoryItemInventoryUnitsByCategoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

SalesCategoryItemsByCategoryId: Visma.net Financials Sales Category Items by Category ID

Get a range of Inventory Items from a specific Sales Category

Catalog: VismaNet

Schema: SalesCategory

Label: Sales Category Items by Category ID

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesCategoryItemsByCategoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the table function SalesCategoryItemWarehouseDetailsByCategoryId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Label: Sales Order Attachments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
orderType		☐		Filter by Order type.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

SalesOrderAttachmentsByNumber: Visma.net Financials Sales Order Attachments by Number

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Attachments by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderAttachmentsByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number

Columns of Table Function

The columns of the table function SalesOrderAttachmentsByNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date when the order should be cancelled if the Back order allowed option has been selected in the Shipping rule field.

SalesOrderAttachmentsByTypeByOrderTypeOrderNumber: Visma.net Financials Sales Order Attachments by Type Order Type Order Number

Get a specific type of OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Attachments by Type Order Type Order Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderAttachmentsByTypeByOrderTypeOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SalesOrderByTypeByOrderTypeOrderNumber: Visma.net Financials Sales Order by Type Order Type Order Number

Get a specific type of OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order by Type Order Type Order Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderByTypeByOrderTypeOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number
orderType		☑		Identifies the Sales Order Type

Columns of Table Function

The columns of the table function SalesOrderByTypeByOrderTypeOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date when the order should be cancelled if the Back order allowed option has been selected in the Shipping rule field.

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SalesOrderLineAttachmentsByNumber: Visma.net Financials Sales Order Line Attachments by Number

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Line Attachments by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLineAttachmentsByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SalesOrderLineAttachmentsByTypeByOrderTypeOrderNumber: Visma.net Financials Sales Order Line Attachments by Type Order Type Order Number

Get a specific type of OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Line Attachments by Type Order Type Order Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLineAttachmentsByTypeByOrderTypeOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number
orderType		☑		Identifies the Sales Order Type

Columns of Table Function

The columns of the table function SalesOrderLineAttachmentsByTypeByOrderTypeOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID

SalesOrderLines: Visma.net Financials Sales Order Lines

Get a range of SO Orders - ScreenId=SO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added force paginationData for all Sales Orders. Response Message has StatusCode OK if GET operation succeed. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and w ill be removed in future versions. The OrderBy parameter has no effect on the result.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

The columns of the table function SalesOrderLines are shown below. Each column has an SQL data type.

SalesOrderLinesByNumber: Visma.net Financials Sales Order Lines by Number

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number

Columns of Table Function

The columns of the table function SalesOrderLinesByNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID used by the customer.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date w hen the order should be cancelled if the Back order allow ed option has been selected in the Shipping rule field.
canceled	char	Canceled	☐	The Delivery settings tab > The Shipping information section > Cancelled > A check box that indicates that the order has been cancelled on the date specified in Cancel by.
cashAccount	varchar2	Cash Account	☐	Payment settings tab > Cash account
cashDiscountDate	datetime	Cash Discount Date	☐	Financial settings tab > Financial information section > Cash discount date > The date w hen the cash discount is available for the invoice based on the credit terms.
commissionable	char	Commissionable	☐	VAT code > The VAT category of the goods mentioned in this line.
commissionableAmount	varchar2		☐	The Commissions tab > Commissionable amount> The amount used to calculate the commission.
commissionAmount	varchar2	Commission Amount	☐	The Commissions tab > Commission amt. >The commission amount earned by

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				the salesperson on this document.
commissionPercent	varchar2	Commission Percentage	☐	The Commissions tab > Commission (%) > The percentage of commission generally earned by the salesperson.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
completed	char	Completed	☐	Completed > A check box that can be selected to indicate to the system that this line is completed.
contactId	int32	Contact ID	☐	The top part > Contact > The contact person of the customer.
currency	varchar2	Currency	☐	The top part > Currency > The currency of the document.
customer_internalId	int32	Customer Internal ID	☐	
customer_name	varchar2	Customer Name	☐	The name of the particular destination of the selected type.
customer_number	varchar2	Customer Number	☐	The identifier of the particular destination of the selected type.
customerOrder	varchar2	Customer Order	☐	The top part > Customer order > The reference number of the original customer document that the sales order is based on.
customerRefNo	varchar2	Customer Reference Number	☐	The top part > External reference > The reference number of the sales order in a third-party application if Visma.net Financials is integrated with such an application and imports the sales orders from it.
customerVATZone_defaultTaxCategory_description	varchar2	VAT Zone Default Tax Category Description	☐	Name of item/description
customerVATZone_defaultTaxCategory_number	varchar2	VAT Zone Default Tax Category Number	☐	Number of item
customerVATZone_defaultVatCategory	varchar2	VAT Zone Default VAT Category	☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_description	varchar2	VAT Zone Description	☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_errorInfo	varchar2		☐	
customerVATZone_id	varchar2	VAT Zone ID	☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.

SalesOrderLinesByTypeByOrderTypeOrderNumber: Visma.net Financials Sales Order Linesby Type Order Type Order Number

Get a specific type of OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Linesby Type Order Type Order Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLinesByTypeByOrderTypeOrderNumber. A value must be provided at all times

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number
orderType		☑		Identifies the Sales Order Type

Columns of Table Function

The columns of the table function SalesOrderLinesByTypeByOrderTypeOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID used by the customer.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date when the order should be cancelled if the Back order allowed option has been selected in the Shipping rule field.
canceled	char	Canceled	☐	The Delivery settings tab > The Shipping information section > Cancelled > A check box that indicates that the order has been cancelled on the date specified in Cancel by.
cashAccount	varchar2	Cash Account	☐	Payment settings tab > Cash account
cashDiscountDate	datetime	Cash Discount Date	☐	Financial settings tab > Financial information section >

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				Cash discount date > The date when the cash discount is available for the invoice based on the credit terms.
commissionable	char	Commissionable	☐	VAT code > The VAT category of the goods mentioned in this line.
commissionableAmount	varchar2		☐	The Commissions tab > Commissionable amount> The amount used to calculate the commission.
commissionAmount	varchar2	Commission Amount	☐	The Commissions tab > Commission amt. >The commission amount earned by the salesperson on this document.
commissionPercent	varchar2	Commission Percentage	☐	The Commissions tab > Commission (%) > The percentage of commission generally earned by the salesperson.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
completed	char	Completed	☐	Completed > A check box that can be selected to indicate to the system that this line is completed.
contactId	int32	Contact ID	☐	The top part > Contact > The contact person of the customer.
currency	varchar2	Currency	☐	The top part > Currency > The currency of the document.
customer_internalId	int32	Customer Internal ID	☐	
customer_name	varchar2	Customer Name	☐	The name of the particular destination of the selected type.
customer_number	varchar2	Customer Number	☐	The identifier of the particular destination of the selected type.
customerOrder	varchar2	Customer Order	☐	The top part > Customer order > The reference number of the original customer document that the sales order is based on.
customerRefNo	varchar2	Customer Reference Number	☐	The top part > External reference > The reference number of the sales order in a third-party application if Visma.net Financials is integrated with such an application and imports the sales orders from it.
customerVATZone_defaultTaxCategory_description	varchar2	VAT Zone Default Tax Category Description	☐	Name of item/description
customerVATZone_defaultTaxCategory_number	varchar2	VAT Zone Default Tax Category Number	☐	Number of item

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
customerVATZone_defaultVatCategory	varchar2	VAT Zone Default VAT Category	☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_description	varchar2	VAT Zone Description	☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_errorInfo	varchar2		☐	
customerVATZone_id	varchar2	VAT Zone ID	☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
customerVATZone_metadata_maxPageSize	int64		☐	
customerVATZone_metadata_totalCount	int64		☐	
date	datetime	Date	☐	Mandatory field: The top part > Date* > The date of the document.
description	varchar2	Description	☐	The top part > Description > A brief description of the document.
discountAmount	double		☐	Document details tab > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line item (if the item is not a free item).
discountCode	varchar2	Discount Code	☐	Mandatory field: Document details tab > Discount details tab > Discount code* > The code of the discount that has been applied to this line.
discountPercent	double	Discount Percent	☐	Document details tab > Discount percent > The percent of the line-level discount that has been applied manually or automatically to this line item (if the item is not a free item).
discountTotal	double	Discount Total	☐	
discountTotalInBaseCurrency	double		☐	
discUnitPrice	double		☐	Document details tab > Disc. unit price > The unit price, which has been recalculated after the application of discounts.
dueDate	datetime	Due Date	☐	Financial settings tab > Financial information section > Due date > The due date of the invoice according to the credit terms.
emailed	char	Emailed	☐	A check box indicating if the document is emailed

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	
expirationDate	datetime	Expiration Date	☐	Expiration date > The expiration date for the item w ith the specified lot number.
externalLink	varchar2		☐	
extPrice	double	Extended Price	☐	Document details tab > Extended cost > The extended price, w hich is the unit price multiplied by the quantity.
fobPoint_description	varchar2	FOB Point Description	☐	Click on the magnifier. > The description.
fobPoint_id	varchar2	FOB Point ID	☐	Click on the magnifier. > The identifier.
freeItem	char	Free Item	☐	A check box that indicates (if selected) that the stock item specified in the row is a free item. This information is collected from the system and not visible on the sales order line.
hold	char	Hold	☐	The top part > Hold > A check box that you select if the document is on hold and should not be processed further at this time.
insurance	char	Insurance	☐	Delivery settings tab > Shipping information section > Insurance > A check box that you select to indicate that insurance is required for this order.
inventory_description	varchar2	Inventory Description	☐	Name of item/description
inventory_number	varchar2	Inventory Number	☐	Number of item
invoiceDate	datetime	Invoice Date	☐	Financial settings tab > Financial information section > Invoice date> The date of the invoice generated for the order.
invoiceNbr_2	varchar2		☐	Financial settings tab > Financial information section > Invoice no.> The invoice number of the invoice generated for this order.
invoiceNbr	varchar2	Invoice Number	☐	The reference number of the invoice generated for this order. This number is collected from the system and not visible on the sales order line.
invoiceSeparately	char	Invoice Separately	☐	Financial settings tab > Financial information section > Invoice separately > A check box that indicating that this document is to be invoiced separately (if that is required).
isRotRutDeductible_2	char	Is ROTRUT Deductible 2	☐	A check box indicating if the document is Rot/rut deductible

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				(applicable for the Swedish markets)
isRotRutDeductible	char		☐	
lastModifiedDateTime	datetime	Last Modified	☐	Background information collected from the system.
lineDescription	varchar2	Line Description	☐	Document details tab > Line description > The description of the unit.
lineNbr	int32		☐	Document details tab > Line no. > The line number of the document.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
lotSerialNbr	varchar2		☐	Lot/serial no. > The lot or serial number of the item for returns
manualDiscount	char	Manual Discount	☐	Document details tab > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
markForPO	char		☐	Mark for purchase order > A check box that indicates (if selected) that the order line was marked for purchasing (if it has not been shipped completely).
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	Icon Notes on top of the window > Pop-up window for providing any user-defined text connected to the order.
note	varchar2	Note	☐	Tables in tab > Icon Notes > Pop-up window for providing any user-defined text connected to the order.
openQty	double	Open Quantity	☐	Document details tab > Open qty. > The quantity of the item to be shipped; that is, the total quantity minus the quantity shipped according to closed shipment documents.
operation	varchar2	Operation	☐	The operation to be performed in the workspace to fulfil the order. This information is collected from the system and not visible on the sales order line.
orderNo	varchar2	Order Number	☐	The top part > Order no.: > The reference number of the document.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
orderTotal	double	Order Total	☐	The top part > Order total > The total amount of the document, which is calculated as follows:Line Total + Misc.Charges + Freight + Premium Freight – Discount Total+ Tax Total
orderTotalInBaseCurrency	double		☐	
orderType	varchar2	Order Type	☐	Mandatory field: The top part > Order type > The type of the document, which is one of the predefined order types or a custom order type created by using the (SO201000) window.
origOrderNbr	varchar2	Original Order Number	☐	The top part > Order no. > The order number of the document.
origOrderType	varchar2	Original Order Type	☐	Mandatory field: The top part > Order type* > The type of the document, which is one of the predefined order types or a custom order type created by using the window SO201000.
overshipThreshold	double		☐	Overship threshold (%) > The maximum percentage of goods shipped (with respect to the ordered quantity) allowed by the customer.
owner_employeeId	varchar2	Owner Employee ID	☐	The Financial settings tab > The Financial information section > Owner > Click the magnifier > Employee ID > The unique identifier, which is assigned to the employee in accordance with the configuration of the EMPLOYEEsegmented key. This information is retrieved from window EP203000.
owner_id	guid	Owner ID	☐	Employee internal user ID. This is the ID of the user linked to the employee
owner_name	varchar2	Owner Name	☐	The Financial settings tab > The Financial information section > Owner > Click the magnifier > Employee name > The name of this employee. This information is retrieved from window EP203000.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRef	varchar2	Payment Reference	☐	Payment settings tab > Payment ref.
poSource	varchar2	PO Source	☐	Purchase order source > The purchase order source to be

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				used to fulfill this line, which can be one of the following options: Purchase to order, Drop-shipment.
postPeriod	varchar2	Post Period	☐	The Financial settings tab > Financial information section > Post period > The period to post the transactions generated by the invoice. Format MMYYYY.
preferredWarehouse_description	varchar2	Preferred Warehouse Description	☐	Click on the magnifier. > The description.
preferredWarehouse_id	varchar2	Preferred Warehouse ID	☐	Click on the magnifier. > The identifier.
printDescriptionOnInvoice	char	Print Description on Invoice	☐	The top part > Print description on invoice > A check box
printNoteOnExternalDocuments	char	Print Note on External Documents	☐	The top part > Print note on external sales documents > A check box
printNoteOnInternalDocuments	char	Print Note on Internal Documents	☐	The top part > Print line note on internal sales documents > A check box
priority	int32	Priority	☐	Delivery settings tab > Shipping information section > Priority > Field only for informational purposes. The level of priority for processing order of this customer, as specified for the customer on the Shipping settings tab on the AR303000 window.
projectCD	varchar2	Project Code	☐	Mandatory field: The top part > Project* > The field consists of Project ID and Project description. Project ID: The identifier for the project with which this document is associated, or the code indicating that this document is not associated with any project; the non-project code is specified in the Project accounting preferences (PM101000) window.
projectTask	int32	Project Task	☐	Project task > The particular task of the project with which this document is associated.
projectTaskCd	varchar2		☐	Project task code > The particular task code of the project with which this document is associated.
qtyOnShipments	double		☐	Document details tab > Qty. on shipments > A read-only column that displays the quantity of the stock item being prepared for shipment and already shipped for this order.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
quantity	double	Quantity	☐	Document details tab > Quantity > The quantity of the item sold, measured in the UoM.
reasonCode	varchar2	Reason Code	☐	Reason code > The reason code to be used for creation or cancellation of the order, if applicable.
requestedOn	datetime	Requested on	☐	Mandatory field: The top part > Requested on* > The date when the customer wants to receive the goods. The default value is the current business date.
requestOn	datetime	Request On	☐	Mandatory field: The top part > Requested on > The date when the customer wants to receive the goods; this date provides the default values for the Requested on dates for order lines.
residentialDelivery	char	Residential Delivery	☐	Delivery settings tab > Shipping information section > Residential delivery > A check box that you select to indicate that the shipment should be delivered to a residential area.
salesPerson_description_2	varchar2		☐	Click on the magnifier. > The description.
salesPerson_description	varchar2	Sales Person Description	☐	Click on the magnifier. > The description.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderPrintByOrderNumberOrderType. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNumber		☑		Identifies the order

Get a range of SO Orders - ScreenId=SO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added force paginationData for all Sales Orders. Response Message has StatusCode OK if GET operation succeed. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Shipments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function SalesOrderShipments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and w ill be removed in future versions. The OrderBy parameter has no effect on the result.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

SalesOrderShipmentsByTypeByOrderTypeOrderNumber: Visma.net Financials Sales Order Shipments by Type Order Type Order Number

Get a specific type of OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrder

Label: Sales Order Shipments by Type Order Type Order Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderShipmentsByTypeByOrderTypeOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number
orderType		☑		Identifies the Sales Order Type

Columns of Table Function

The columns of the table function SalesOrderShipmentsByTypeByOrderTypeOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicSalesOrderAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicSalesOrderLineAttachmentsByOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function BasicSalesOrderLinesByTypeOrderTypeOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SalesOrderAttachmentsV2ByOrderNumber

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderAttachmentsV2ByOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number

Columns of Table Function

SalesOrderLineAttachmentsV2

Get a range of SO Orders - ScreenId=SO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for all Sales Orders. Response Message has StatusCode OK if GET operation succeed. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLineAttachmentsV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

SalesOrderLineAttachmentsV2ByOrderNumber

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLineAttachmentsV2ByOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number

Columns of Table Function

The columns of the table function SalesOrderLineAttachmentsV2ByOrderNumber are shown below. Each column has an SQL data type.

SalesOrderLinesV2

Get a range of SO Orders - ScreenId=SO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for all Sales Orders. Response Message has StatusCode OK if GET operation succeed. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLinesV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

The columns of the table function SalesOrderLinesV2 are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID used by the customer.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation

SalesOrderLinesV2ByOrderNumber

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderLinesV2ByOrderNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number

Columns of Table Function

The columns of the table function SalesOrderLinesV2ByOrderNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
alternateID	varchar2	Alternate ID	☐	Alternate ID > The alternate ID for the item, such as the item ID used by the customer.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
cancelBy	datetime	Cancel by	☐	Delivery settings tab > Shipping information section > Cancel by > The date w hen the order should be cancelled if the Back order allow ed option has been selected in the Shipping rule field.
canceled	char	Canceled	☐	The Delivery settings tab > The Shipping information section > Cancelled > A check box that indicates that the order has been cancelled on the date specified in Cancel by.
cashAccount	varchar2	Cash Account	☐	Payment settings tab > Cash account
cashDiscountDate	datetime	Cash Discount Date	☐	Financial settings tab > Financial information section > Cash discount date > The date w hen the cash discount is available for the invoice based on the credit terms.
commissionable	char	Commissionable	☐	VAT code > The VAT category of the goods mentioned in this line.
commissionableAmount	varchar2		☐	The Commissions tab > Commissionable amount> The amount used to calculate the commission.
commissionAmount	varchar2	Commission Amount	☐	The Commissions tab > Commission amt. >The commission amount earned by the salesperson on this document.
commissionPercent	varchar2	Commission Percentage	☐	The Commissions tab > Commission (%) > The percentage of commission generally earned by the salesperson.

SalesOrderShipmentsV2

Get a range of SO Orders - ScreenId=SO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for all Sales Orders. Response Message has StatusCode OK if GET operation succeed. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderShipmentsV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

The columns of the table function SalesOrderShipmentsV2 are shown below. Each column has an SQL data type.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function SalesOrdersV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		Filter on Order no. greater than value.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderType		☐		Filter by Order type.
show Notes		☐		Set to true to include notes.
status		☐		Select to filter on status on order. (Values: Open, Hold, CreditHold, Completed, Cancelled, BackOrder, Shipping, Invoiced, PendingApproval, Voided)

Columns of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The columns of the table function SalesOrdersV2 are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

Name	Data Type	Label	Required	Documentation
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.

SalesOrderV2ByNumber

Get a specific SO OrderData for a single Sales Order. OBS: End of life March 31 2026. REPLACED BY v3 ENDPOINT. SEE https://salesorder.visma.net/swagger/index.html

Catalog: VismaNet

Schema: SalesOrderV2

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SalesOrderV2ByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
orderNbr		☑		Identifies the Sales Order Number

Columns of Table Function

The columns of the table function SalesOrderV2ByNumber are shown below. Each column has an SQL data type.

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ShipmentDetailLineAllocationsByNumber: Visma.net Financials Shipment Detail Line Allocations by Number

Get a specific ShipmentData for a single Shipment. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Shipment

Label: Shipment Detail Line Allocations by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ShipmentDetailLineAllocationsByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
shipmentNbr		☑		Identifies the Shipment

Columns of Table Function

The columns of the table function ShipmentDetailLineAllocationsByNumber are shown below. Each column has an SQL data type.

ShipmentDetailLinesByNumber: Visma.net Financials Shipment Detail Lines by Number

Get a specific ShipmentData for a single Shipment. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Shipment

Label: Shipment Detail Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ShipmentDetailLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
shipmentNbr		☑		Identifies the Shipment

lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and w ill be removed in future versions. The OrderBy parameter has no effect on the result.
shipmentDate		☐		Shipment DateAccepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __ShipmentDate__ and __ShipmentDate__ are __mutually inclusive__.
shipmentDateCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __ShipmentDate__ and __ShipmentDateCondition__ are __mutually inclusive__.
shipmentType		☐		Filter by Shipment Type (Values: Issue, DropShip, Transfer)
status		☐		Values: Open, Hold, Completed, Cancelled, Confirmed, Invoiced, Receipted, AutoGenerated, PartiallyInvoiced.

Columns of Table Function

The columns of the table function ShipmentOrderLines are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
container	char		☐	Delivery settings tab > Intrastat section > Container > This check box indicates (if selected) that the shipment gets marked as shipped in container for Intrastat reporting purposes.
controlQuantity	double	Control Quantity	☐	The top part > Control quantity > The control value, w hich you manually enter as a value equal to the shipped quantity if the Validate shipment total on confirmation check box has been selected in the Sales orders preferences (SO101000) w indow .
currencyId	varchar2	Currency ID	☐	Delivery settings tab > Freight currency > By default, it is the currency of the sales order, but you can change it if needed.
customDateTimeUTC1	datetime		☐	A free custom colum of type DateTime - in UTC timezone
customDec1	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customDec2	double		☐	A free custom colum of type decimal w ith max 4 decimals.
customer_internalId	int32	Customer Internal ID	☐	
customer_name	varchar2	Customer Name	☐	The name of the particular destination of the selected type.
customer_number	varchar2	Customer Number	☐	The identifier of the particular destination of the selected type.
customInt1	int32		☐	A free custom colum of type int
customInt2	int32		☐	A free custom colum of type int
customStr1	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr2	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr3	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr4	varchar2		☐	A free custom colum of type string w ith max length 100.
customStr5	varchar2		☐	A free custom colum of type string w ith max length 100.
deliveryAddress_addressId	int32	Delivery Address ID	☐	
deliveryAddress_addressLine1	varchar2	Delivery Address Line 1	☐	Address 1 > The first line of the customer's/supplier's/company's/ employee's contact address.
deliveryAddress_addressLine2	varchar2	Delivery Address Line 2	☐	Address 2 > The second line of the address.
deliveryAddress_addressLine3	varchar2	Delivery Address Line 3	☐	Address 3 > The third line of the address.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deliveryAddress_city	varchar2	Delivery Address City	☐	City > The city.
deliveryAddress_country_errorInfo	varchar2		☐	
deliveryAddress_country_id	varchar2	Delivery Address Country ID	☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
deliveryAddress_country_metadata_maxPageSize	int64		☐	
deliveryAddress_country_metadata_totalCount	int64		☐	
deliveryAddress_country_name	varchar2	Delivery Address Country Name	☐	Mandatory field: Country name* > The complete name of the country.
deliveryAddress_county_id	varchar2	Delivery Address County ID	☐	Click the magnifier > The identifier
deliveryAddress_county_name	varchar2	Delivery Address County Name	☐	Click the magnifier > The displayed name
deliveryAddress_overrideAddress	char		☐	Override address > A check box that you select to not include the default address information and to type new address information.
deliveryAddress_postalCode	varchar2	Delivery Address Postal Code	☐	Postcode > The postcode.
deliveryContact_attention	varchar2	Delivery Contact Attention	☐	Attention > The attention line as it is used in your customer's/supplier's/company's business letters. The intention of this line is to direct the letter to the right person if the letter is not addressed to any specific person.
deliveryContact_contactId	int32	Delivery Contact ID	☐	
deliveryContact_email	varchar2	Delivery Contact Email Address	☐	Email > The email address of the customer/supplier/company as a business entity.
deliveryContact_fax	varchar2	Delivery Contact Fax	☐	Fax > The fax number.
deliveryContact_name	varchar2	Delivery Contact Name	☐	Name > The legal name of to appear on the documents.
deliveryContact_overrideContact	char		☐	Override contact > A check box that you select to not use+ the default contact information and to type new contact information.
deliveryContact_phone1	varchar2	Delivery Contact Phone 1	☐	Phone 1 > The default phone number.
deliveryContact_phone2	varchar2	Delivery Contact Phone 2	☐	Phone 2 > An additional phone number.
deliveryContact_web	varchar2	Delivery Contact Website	☐	Web > The website of the company, if one exists.
errorInfo	varchar2	Error Message	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
fobPoint_description	varchar2	FOB Point Description	☐	Click on the magnifier. > The description.
fobPoint_id	varchar2	FOB Point ID	☐	Click on the magnifier. > The identifier.
freightAmt	double		☐	Delivery settings tab > Shipping information section > Freight amt. > The amount of freight the customer w ill be charged for the shipment.
freightCost	double		☐	Delivery settings tab > Shipping information section > Freight cost > The freight cost of the shipment.
fromWarehouse_description	varchar2		☐	Click on the magnifier. > The description.
fromWarehouse_id	varchar2		☐	Click on the magnifier. > The identifier.
hold	char	Hold	☐	The top part > Hold > This check box indicates (if selected) that the documents cannot be processed further until the check box is cleared.
insurance	char	Insurance	☐	Delivery settings tab > Shipping information section > Insurance > This check box indicates (if selected) that insurance is required for the shipment.
inventoryDocType	varchar2		☐	Orders tab > Inventory doc. type > The type of the inventory document that lists the items for this shipment.
inventoryRefNbr	varchar2		☐	Orders tab > Inventory ref. no. > The reference number of the inventory document that lists the items for this shipment.
invoiceNbr	varchar2	Invoice Number	☐	Orders tab > Invoice no. > The reference number of the invoice for the goods shipped.
invoiceType	varchar2		☐	Orders tab > Invoice type > The type of invoice for the goods shipped for the sales order.
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
modeOfTrasport_description	varchar2		☐	Click on the magnifier. > The description.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
modeOfTrasport_id	int32		☐	Click on the magnifier. > The identifier.
note_2	varchar2	Note 2	☐	
note	varchar2	Note	☐	
operation	varchar2	Operation	☐	The top part > Operation > The operation to be performed in the Inventory w orkspace for this shipment: Issue or Receipt.
orderNbr	varchar2	Order Number	☐	Orders tab > Order no. > The reference number of the sales or transfer order.
orderType	varchar2	Order Type	☐	Orders tab > Order typer > The type of the order.
ow ner_id	guid	Ow ner ID	☐	Click the magnifier > The identifier
ow ner_name	varchar2	Ow ner Name	☐	Click the magnifier > The displayed name
packages	int32	Packages	☐	The top part > Packages > The number of boxes included in this shipment.
packagesVolume	double		☐	The top part > Package volume > The total volume of the shipment that includes the volume of boxes (for boxes determined automatically).
packagesWeight	double	Packages Weight	☐	The top part > Package w eight > The total w eight of the shipment that includes the w eight of boxes (for boxes determined automatically).
residentialDelivery	char	Residential Delivery	☐	Delivery settings tab > Shipping information section > Residential delivery > This check box indicates (if selected) that the shipping address is a residential one.
saturdayDelivery	char	Saturday Delivery	☐	Delivery settings tab > Shipping information section > Saturday delivery > This check box indicates delivery on saturday.
shipmentDate	datetime	Shipment Date	☐	Mandatory field: The top part > Shipment date* > The date w hen the document has been created.
shipmentNumber	varchar2	Shipment Number	☐	The top part > Shipment no > The unique reference number of the document, w hich is automatically generated by the system.
shipmentType	varchar2	Shipment Type	☐	The top part > Type > The type of the shipment document, w hich can be one of the follow ing options: Shipment, Transfer.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
shippedQty	double	Shipped Quantity	☐	Orders tab > Shipped qty. > The quantity of goods shipped in accordance w ith the order.
shippedQuantity	double		☐	The top part > Shipped quantity > The quantity of goods shipped.
shippedVolume_2	double		☐	The top part > Shipped volume > The total volume of the items in the shipment.
shippedVolume	double	Shipped Volume	☐	Orders tab > Shipped volume > The volume of the goods shipped in accordance w ith the sales or transfer order.
shippedWeight_2	double		☐	The top part > Shipped w eight > The w eight of the goods shipped.
shippedWeight	double	Shipped Weight	☐	Orders tab > Shipped w eight > The w eight of the goods shipped in accordance w ith the order.
shippingTerms_description	varchar2	Shipping Terms Description	☐	Click on the magnifier. > The description.
shippingTerms_id	varchar2	Shipping Terms ID	☐	Click on the magnifier. > The identifier.
shippingZone_description	varchar2	Shipping Zone Description	☐	Click on the magnifier. > The description.

status	varchar2	Status	☐	The top part > Status > The status of the document.
timeStamp	blob	Timestamp	☐	
toWarehouse_description	varchar2	To Warehouse Description	☐	Click on the magnifier. > The description.
toWarehouse_id	varchar2	To Warehouse ID	☐	Click on the magnifier. > The identifier.
transactionType_description	varchar2	Transaction Type Description	☐	Click on the magnifier. > The description.
transactionType_id	int32	Transaction Type ID	☐	Click on the magnifier. > The identifier.
useCustomerAccount	char		☐	

ShipmentOrderLinesByNumber: Visma.net Financials Shipment Order Lines by Number

Get a specific ShipmentData for a single Shipment. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Schema: Shipment

Label: Shipment Order Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ShipmentOrderLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
includeCustomFreeFields		☐		Optional parameter to request custom free fields.
shipmentNbr		☑		Identifies the Shipment

Columns of Table Function

The columns of the table function ShipmentOrderLinesByNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
container	char		☐	Delivery settings tab > Intrastat section > Container > This check box indicates (if selected) that the shipment gets marked as shipped in container for Intrastat reporting purposes.
controlQuantity	double	Control Quantity	☐	The top part > Control quantity > The control value, w hich you manually enter as a value equal to the shipped quantity if the Validate shipment total on confirmation check box has been selected in the Sales orders preferences (SO101000) w indow .

ShipmentPackageLines: Visma.net Financials Shipment Package Lines

Get a range of SO Shipments - ScreenId=SO302000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: Shipment

Label: Shipment Package Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function ShipmentPackageLines. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
customerId		☐		
customerNumber		☐		
greaterThanValue		☐		This field has been deprecated and w ill be removed in future versions. The GreaterThanValue parameter has no effect on the result.
includeCustomFreeFields		☐		Parameter to include custom free fields information in the result set, if true then custom free fields w ill be included in the result set
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.

ShipmentPackageLinesByNumber: Visma.net Financials Shipment Package Lines by Number

Get a specific ShipmentData for a single Shipment. The response headers include an ETag after a successful GET operation.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Catalog: VismaNet

Schema: Shipment

Label: Shipment Package Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ShipmentPackageLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

ShipmentPrintPickListByNumber: Visma.net Financials Shipment Print Picklist by Number

Get the pick list report

Catalog: VismaNet

Schema: Shipment

Label: Shipment Print Picklist by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function ShipmentPrintPickListByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

StockTakeLinesV2: Visma.net Financials Stock Take Lines

Get a range of stocktakes - ScreenId=IN305000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information. If requested page size is greater than allowed max page size, request will be limited to max page size.

Catalog: VismaNet

Schema: StocktakeV2

Label: Stock Take Lines

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function StockTakeLinesV2. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

Schema: Supplier

Label: Supplier Attributes by Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierAttributesByCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SupplierClassAttributeDetailsBySupplierClassId: Visma.net Financials Supplier Class Attribute Details by Supplier Class ID

Get a specific supplier classData for a single supplier class. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Supplier

Label: Supplier Class Attribute Details by Supplier Class ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierClassAttributeDetailsBySupplierClassId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SupplierDocumentsBySupplierNumber: Visma.net Financials Supplier Documents by Supplier Number

Gets a range of documents for a specific supplier

Catalog: VismaNet

Schema: Supplier

Label: Supplier Documents by Supplier Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierDocumentsBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:*

Columns of Table Function

The columns of the table function SupplierDocumentsBySupplierNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	Document details tab > Amount > Read-only. The total amount for the specified quantity of items or services of this type (after the discount has been taken).
amountInCurrency	double	Amount in Currency	☐	An automatic calculation of the amount w ith the currency set as default for supplier.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.

Name	Data Type	Label	Required	Documentation
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
createdDateTime	datetime	Created	☐	
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
lastModifiedDateTime	datetime	Last Modified	☐	
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
