Name	Data Type	Label	Required	Documentation
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierDocumentSubaccountSegmentsBySupplierNumber: Visma.net Financials Supplier Document Subaccount Segments by Supplier Number

Gets a range of documents for a specific supplier

Catalog: VismaNet

Schema: Supplier

Label: Supplier Document Subaccount Segments by Supplier Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierDocumentSubaccountSegmentsBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for

Catalog: VismaNet

Schema: Supplier

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceInvoiceLinePrebookSubAccountSegmentsBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
docDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __Docate__ and

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
project		☐		Filter by the project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplierNumber		☑		Identifies the supplier for w hich to return data

Columns of Table Function

The columns of the table function SupplierInvoiceInvoiceLinePrebookSubAccountSegmentsBySupplierNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It show s the ID of the deferral schedule associated

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				with the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description_2	varchar2	Description 2	☐	The Top part > Description > A user-provided description for this supplier ledger document.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The following types

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice with retainage.
retainagePct	double	Retainage Percentage	☐	
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference between the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
segmentDescription	varchar2		☐	The Segment values window > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values window > The Top part > The ID of

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values w indow > The table > The description of the segment value.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating w hether the item is a stock item or not.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSi ze	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
subaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
subaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
subaccount_segmentValueDescrip tion	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
subaccountId	int32		☐	SubID > The identifier of the subaccount.
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLandedCostsBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications will count towards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance when retrieving

Name	Data Type	Label	Required	Documentation
				inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
description_2	varchar2	Description 2	☐	The Top part > Description > A user-provided description for this supplier ledger document.
description	varchar2	Description	☐	Landed Costs Tab > Description > The description of the landed cost
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
inventoryId	varchar2	Inventory ID	☐	Landed Costs Tab > Item ID > The ID of the inventory item

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
landedCostCodeId	varchar2		☐	Landed Costs Tab > Landed cost code > The Landed Cost Code ID If the Landed Cost Code
lastModifiedDateTime	datetime	Last Modified	☐	
lineNumber	int32	Line Number	☐	Landed Costs Tab > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
locationId	varchar2	Location ID	☐	Landed Costs Tab > Location > The ID of the w arehouse location
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note	varchar2	Note	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section >

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				Approved for payment > When set to true indicates that the document is approved for payment.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
purcahseOrderReceiptNumber	varchar2		☐	Landed Costs Tab > Purchase order receipt no. > The purchase order receipt number
purchaseReceiptType	varchar2		☐	Landed Costs Tab > Purchase Receipt Type > The purchase receipt type
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice with retainage.
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference between the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
siteId	varchar2		☐	Landed Costs Tab > Warehouse > The ID of the warehouse
status	varchar2	Status	☐	The Top part > Document status > A read-only field that shows the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overwriting each other (by using ETags and If-Match headers)
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCategoryId	varchar2	VAT Category ID	☐	Landed Costs Tab > VAT Category > The ID of VAT cateogry
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

				is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineAttachmentsBySupplierNumber: Visma.net Financials Supplier Invoice Line Attachments by Supplier Number

Get a range of invoices for a specific supplierRequest page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: Supplier

Label: Supplier Invoice Line Attachments by Supplier Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineAttachmentsBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.

project		☐		Filter by the project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplierNumber		☑		Identifies the supplier for w hich to return data

Columns of Table Function

The columns of the table function SupplierInvoiceLineAttachmentsBySupplierNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				(or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or will be taken in the document, which the system calculates based in the specified credit terms.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It show s the ID of the deferral schedule associated w ith the original document (such as a purchase invoice).

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
id	guid	ID	☐	The ID of the attachment
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime	datetime	Last Modified	☐	
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
name	varchar2	Name	☐	The name of the attachment.
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
prebookSubaccount_active	char		☐	Active > The status of the identifier.
prebookSubaccount_description	varchar2		☐	Description > The description of the identifier.
prebookSubaccount_errorInfo	varchar2		☐	
prebookSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
prebookSubaccount_metadata_maxPageSize	int64		☐	
prebookSubaccount_metadata_totalCount	int64		☐	
prebookSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
prebookSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
prebookSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice with retainage.
retainagePct	double	Retainage Percentage	☐	
revision	int32	Revision	☐	The version of the attachment.
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference between the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT

Name	Data Type	Label	Required	Documentation
				amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating w hether the item is a stock item or not.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
termEndDate	datetime	Term End Date	☐	
termStartDate	datetime	Term Start Date	☐	
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overwriting each other (by using ETags and If-Match headers)
transactionDescription	varchar2		☐	The table > Transaction descr. > Any description relevant to the transaction. An alphanumeric string of up to 30 characters may be used.
unitCost	double	Unit Cost	☐	The table > Unit cost > The unit cost of the item.
unitCostInCurrency	double		☐	Background calculation giving you the Unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
uom	varchar2	Unit of Measure	☐	The table > UoM > The unit of measure for the item.
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
w ithholdingTax	double		☐	The Top part > With. tax > The amount of w ithholding tax calculated for the document, if applicable.
w ithholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLinesBySupplierNumber: Visma.net Financials Supplier Invoice Lines by Supplier Number

Get a range of invoices for a specific supplierRequest page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: Supplier

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Label: Supplier Invoice Lines by Supplier Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLinesBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.

Name	Data Type	Required	Default Value	Documentation
expandApproval		☐		Set to true to include approval information.
expandAttachment		☐		Set to true if you want to see all attachments regarding this document.
expandLandedCosts		☐		Expland landed cost lines
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
expandNote		☐		Set to true to include description.
financialPeriod		☐		Filter by Financial Period, format YYYYPP
greaterThanValue		☐		Greater than value. The item which is the object for this, varies from API to API.
item		☐		Filter by Item used into the document lines
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
project		☐		Filter by the project with which the document is associated.
released		☐		Parameter for showing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplierNumber		☑		Identifies the supplier for which to return data

Columns of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The columns of the table function SupplierInvoiceLinesBySupplierNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				the current date, w hich can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It show s the ID of the deferral schedule associated w ith the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

prebookSubaccount_metadata_totalCount	int64		☐	
prebookSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
prebookSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
prebookSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice w ith retainage.
retainagePct	double	Retainage Percentage	☐	
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference betw een the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating w hether the item is a stock item or not.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
termEndDate	datetime	Term End Date	☐	
termStartDate	datetime	Term Start Date	☐	
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overwriting each other (by using ETags and If-Match headers)
transactionDescription	varchar2		☐	The table > Transaction descr. > Any description relevant to the transaction. An alphanumeric string of up to 30 characters may be used.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
unitCost	double	Unit Cost	☐	The table > Unit cost > The unit cost of the item.
unitCostInCurrency	double		☐	Background calculation giving you the Unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
uom	varchar2	Unit of Measure	☐	The table > UoM > The unit of measure for the item.
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineSubaccountSegmentsBySupplierNumber: Visma.net Financials Supplier Invoice Line Subaccount Segments by Supplier Number

Get a range of invoices for a specific supplierRequest page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: Supplier

Label: Supplier Invoice Line Subaccount Segments by Supplier Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineSubaccountSegmentsBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.

Name	Data Type	Required	Default Value	Documentation
project		☐		Filter by the project with which the document is associated.
released		☐		Parameter for showing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplierNumber		☑		Identifies the supplier for which to return data

Columns of Table Function

The columns of the table function SupplierInvoiceLineSubaccountSegmentsBySupplierNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval,

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or will be taken in the document, which the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, which the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, which can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It shows the ID of the deferral schedule associated with the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description_2	varchar2	Description 2	☐	The Top part > Description > A user-provided description for this supplier ledger document.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up window for providing any user-defined text connected with to invoice.
note	varchar2	Note	☐	The table > Icon Notes > Pop-up window for providing any user-defined text connected with to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, which can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date when the invoice should be paid. The date is the difference between the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected with the payment.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
prebookSubaccount_active	char		☐	Active > The status of the identifier.
prebookSubaccount_description	varchar2		☐	Description > The description of the identifier.
prebookSubaccount_errorInfo	varchar2		☐	
prebookSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
prebookSubaccount_metadata_maxPageSize	int64		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
prebookSubaccount_metadata_totalCount	int64		☐	
prebookSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
prebookSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
prebookSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
prebookSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
prebookSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
prebookSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
prebookSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice w ith retainage.
retainagePct	double	Retainage Percentage	☐	
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference betw een the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoicesBySupplierNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.

				is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierPaymentMethodDetails: Visma.net Financials Supplier Payment Method Details

Get a range of suppliers - ScreenId=AP303000

Catalog: VismaNet

Schema: Supplier

Label: Supplier Payment Method Details

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierPaymentMethodDetails. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
attributes		☐		
corporateId		☐		
expandAccountInformation		☐		
expandNote		☐		
greaterThanValue		☐		
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
name		☐		Contains supplier name.
orderBy		☐		
status		☐		Values: Active, OnHold, HoldPayments, Inactive, OneTime.
vatRegistrationId		☐

SupplierPaymentMethodDetailsByCode: Visma.net Financials Supplier Payment Method Details by Code

Get a specific supplierData for a single supplier. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: Supplier

Label: Supplier Payment Method Details by Code

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierPaymentMethodDetailsByCode. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

SupplierPOBalances: Visma.net Financials Supplier PO Balances

Get the PO balance of a range of suppliers

Catalog: VismaNet

Schema: Supplier

Label: Supplier PO Balances

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierPOBalances. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
greaterThanValue		☐		
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐

3.1.94 Schema: SupplierAccount

3.1.94.1 Tables

SupplierAccountBySupplierId

Get expense accounts for a supplier

Catalog: VismaNet

Schema: SupplierAccount

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierAccountBySupplierId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
linesNonTaxable		☐		Indicates if all lines are taxable or not. Default is false
supplierId		☑		The id of the supplier
vatRegistrationId		☐		The vat registration id of the supplier

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Columns of Table Function

The columns of the table function SupplierAccountBySupplierId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
supplierAccount_accountID	varchar2		☐	The default Expense Account ID for the supplier
supplierAccount_name	varchar2		☐	The supplier name
supplierAccount_number	varchar2		☐	The supplier number
supplierAccount_subaccount_active	char		☐	Active > The status of the identifier.
supplierAccount_subaccount_description	varchar2		☐	Description > The description of the identifier.
supplierAccount_subaccount_errorInfo	varchar2		☐

Gets a range of supplier documents - ScreenId=AP301000Get a range of Purchase Order - ScreenId=PO301000Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeChange log:2020-May:Added forced pagination

Catalog: VismaNet

Schema: SupplierDocument

Label: Supplier Document Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierDocumentSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.

SupplierInvoiceAttachmentsByApprovalDocumentId: Visma.net Financials Supplier Invoice Attachments by Approval Document ID

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Attachments by Approval Document ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceAttachmentsByApprovalDocumentId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

Schema: SupplierInvoice

Label: Supplier Invoice Attachmentsby Type Document Type Invoice Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceAttachmentsByTypeByDocumentTypeInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentType		☑		Identifies the Invoice
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceAttachmentsByTypeByDocumentTypeInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
id	guid	ID	☐	The ID of the attachment
lastModifiedDateTime	datetime	Last Modified	☐	
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
name	varchar2	Name	☐	The name of the attachment.
note	varchar2	Note	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date when the invoice should be paid. The date is the difference between the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected with the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice with retainage.
revision	int32	Revision	☐	The version of the attachment.
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference between the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that shows the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled,

Name	Data Type	Label	Required	Documentation
				Open, Closed, Printed, Prebooked, Reserved]
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, w hich defines w hich amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				the VAT amount specified in the original document.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceByApprovalDocumentId_InvoiceLinesPrebookSubAccountSegments

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the table function SupplierInvoiceByApprovalDocumentId_InvoiceLinesPrebookSubAccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
systemId		☑		SystemID referes to the approval document id created w hen the document is sent to approval

Columns of Table Function

The columns of the table function SupplierInvoiceByApprovalDocumentId_InvoiceLinesPrebookSubAccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.

vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceByApprovalDocumentId_LandedCosts

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Schema: SupplierInvoice

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceByApprovalDocumentId_LandedCosts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
systemId		☑		SystemID referes to the approval document id created w hen the document is sent to approval

Columns of Table Function

The columns of the table function SupplierInvoiceByApprovalDocumentId_LandedCosts are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount_2	double		☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
amount	double	Amount	☐	Landed Costs Tab > Amount > The amount of the landed cost
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.

expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceByinvoiceNumber_InvoiceLinesPrebookSubAccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It show s the ID of the deferral schedule associated w ith the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description_2	varchar2	Description 2	☐	The Top part > Description > A user-provided description for this supplier ledger document.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is

Name	Data Type	Label	Required	Documentation
				applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice w ith retainage.
retainagePct	double	Retainage Percentage	☐	
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference betw een the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.

Name	Data Type	Label	Required	Documentation
segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values w indow > The Top part > The ID of the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values w indow > The table > The description of the segment value.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating w hether the item is a stock item or not.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
subaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
subaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
subaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
subaccountId	int32		☐	SubID > The identifier of the subaccount.
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
termEndDate	datetime	Term End Date	☐	
termStartDate	datetime	Term Start Date	☐

Name	Data Type	Label	Required	Documentation
timeStamp_2	blob		☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.
transactionDescription	varchar2		☐	The table > Transaction descr. > Any description relevant to the transaction. An alphanumeric string of up to 30 characters may be used.
unitCost	double	Unit Cost	☐	The table > Unit cost > The unit cost of the item.
unitCostInCurrency	double		☐	Background calculation giving you the Unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
uom	varchar2	Unit of Measure	☐	The table > UoM > The unit of measure for the item.
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLandedCosts

Get a range of Invoices - ScreenId=AP301000. Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: SupplierInvoice

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLandedCosts. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications will count towards the balance._Note:_ __Balance__ and

SupplierInvoiceLandedCostsByInvoiceNumber

GET a specific invoice. Only standard invoices are supported. Credit adjustments, credit notes or Prepayments are excluded.Data for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLandedCostsByInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceLandedCostsByInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount_2	double		☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
amount	double	Amount	☐	Landed Costs Tab > Amount > The amount of the landed cost
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.

retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice w ith retainage.
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference betw een the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
siteId	varchar2		☐	Landed Costs Tab > Warehouse > The ID of the w arehouse
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, w hich defines w hich amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCategoryId	varchar2	VAT Category ID	☐	Landed Costs Tab > VAT Category > The ID of VAT cateogry
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
w ithholdingTax	double		☐	The Top part > With. tax > The amount of w ithholding tax calculated for the document, if applicable.
w ithholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineAttachments: Visma.net Financials Supplier Invoice Line Attachments

Get a range of Invoices - ScreenId=AP301000. Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Attachments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineAttachments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_

project		☐		Filter by the project with which the document is associated.
released		☐		Parameter for showing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplier		☐		Filter by Supplier

Columns of Table Function

The columns of the table function SupplierInvoiceLineAttachments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, which can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It shows the ID of the deferral schedule associated with the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
id	guid	ID	☐	The ID of the attachment
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime	datetime	Last Modified	☐	
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
name	varchar2	Name	☐	The name of the attachment.
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The

SupplierInvoiceLineAttachmentsByApprovalDocumentId: Visma.net Financials Supplier Invoice Line Attachments by Approval Document ID

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Attachments by Approval Document ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineAttachmentsByApprovalDocumentId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
systemId		☑		SystemID referes to the approval document id created when the document is sent to approval

Columns of Table Function

The columns of the table function SupplierInvoiceLineAttachmentsByApprovalDocumentId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval,

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated with the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or will be taken in the document, which the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, which the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.

vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineAttachmentsByNumber: Visma.net Financials Supplier Invoice Line Attachments by Number

GET a specific invoice. Only standard invoices are supported. Credit adjustments, credit notes or Prepayments are excluded.Data for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Attachments by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineAttachmentsByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SupplierInvoiceLineAttachmentsByTypeByDocumentTypeInvoiceNumber: Visma.net Financials Supplier Invoice Line Attachments by Type Document Type Invoice Number

Get a specific Invoice, DebitAdj, CreditAdj or PrepaymentData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Attachments by Type Document Type Invoice Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineAttachmentsByTypeByDocumentTypeInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentType		☑		Identifies the Invoice
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceLineAttachmentsByTypeByDocumentTypeInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval,

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.

Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the

				to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
project		☐		Filter by the project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplier		☐		Filter by Supplier

Columns of Table Function

The columns of the table function SupplierInvoiceLines are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, which can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It shows the ID of the deferral schedule associated with the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime	datetime	Last Modified	☐	
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
prebookSubaccount_active	char		☐	Active > The status of the identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
prebookSubaccount_description	varchar2		☐	Description > The description of the identifier.
prebookSubaccount_errorInfo	varchar2		☐	
prebookSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
prebookSubaccount_metadata_maxPageSize	int64		☐	
prebookSubaccount_metadata_totalCount	int64		☐	
prebookSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
prebookSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
prebookSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice with retainage.
retainagePct	double	Retainage Percentage	☐	
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference between the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that shows the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating whether the item is a stock item or not.
subaccount_active	char	Sub Account Active 2	☐	Active > The status of the identifier.
subaccount_description	varchar2	Subaccount Description	☐	Description > The description of the identifier.
subaccount_errorInfo	varchar2	Sub Account Error Message	☐	
subaccount_lastModifiedDateTime	datetime	Sub Account Last Modified	☐	System generated information.
subaccount_metadata_maxPageSize	int64	Sub Account Metadata Max Pagesize	☐	
subaccount_metadata_totalCount	int64	Sub Account Metadata Total Count	☐	
subaccount_subaccountId	int32	Sub Account ID	☐	SubID > The identifier of the subaccount.
subaccount_subaccountNumber	varchar2	Sub Account Number	☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
subaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .

vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLinesByApprovalDocumentId: Visma.net Financials Supplier Invoice Lines by Approval Document ID

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Lines by Approval Document ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLinesByApprovalDocumentId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
systemId		☑		SystemID referes to the approval document id created w hen the document is sent to approval

Columns of Table Function

The columns of the table function SupplierInvoiceLinesByApprovalDocumentId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.

vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
w ithholdingTax	double		☐	The Top part > With. tax > The amount of w ithholding tax calculated for the document, if applicable.
w ithholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLinesByNumber: Visma.net Financials Supplier Invoice Lines by Number

GET a specific invoice. Only standard invoices are supported. Credit adjustments, credit notes or Prepayments are excluded.Data for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Lines by Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLinesByNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceLinesByNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				ledger document after VAT (if inclusive) and the discount as specified in the tabs below.
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLinesByTypeDocumentTypeInvoiceNumber: Visma.net Financials Supplier Invoice Lines by Type Document Type Invoice Number

Get a specific Invoice, DebitAdj, CreditAdj or PrepaymentData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Lines by Type Document Type Invoice Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLinesByTypeDocumentTypeInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
w ithholdingTax	double		☐	The Top part > With. tax > The amount of w ithholding tax calculated for the document, if applicable.
w ithholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLinesPrebookSubaccountSegmentsByTypeByDocumentType

Get a specific Invoice, DebitAdj, CreditAdj or PrepaymentData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Schema: SupplierInvoice

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLinesPrebookSubaccountSegmentsByTypeByDocumentType. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentType		☑		Identifies the Invoice
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceLinesPrebookSubaccountSegmentsByTypeByDocumentType are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.

				other (by using ETags and If-Match headers)
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.
transactionDescription	varchar2		☐	The table > Transaction descr. > Any description relevant to the transaction. An alphanumeric string of up to 30 characters may be used.
unitCost	double	Unit Cost	☐	The table > Unit cost > The unit cost of the item.
unitCostInCurrency	double		☐	Background calculation giving you the Unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
uom	varchar2	Unit of Measure	☐	The table > UoM > The unit of measure for the item.
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineSubaccountSegments: Visma.net Financials Supplier Invoice Line Subaccount Segments

Get a range of Invoices - ScreenId=AP301000. Request page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page size

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Subaccount Segments

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineSubaccountSegments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications will count towards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
createdDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.
docDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __Docate__ and __DocDateCondition__ are __mutually inclusive__.
docDateCondition		☐		This value represents the condition to be applied to the Document Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DocumentDate__ and __DocumentDateCondition__ are __mutually inclusive__.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
documentType		☐		By type of document. (Values: Invoice, CreditAdj, DebitAdj, Prepayment, Refund, Payment)
dueDate		☐		This value indicates the date the document is due for payment. Use it to retrieve all records that have the Due date since that time, up to the future.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```* ```yyyy-MM-dd```_Note:_ __DueDate__ and __DueDateConditionCondition__ are __mutually inclusive__.
dueDateCondition		☐		This value represents the condition to be applied to the Due Date w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __DueDate__ and __DueDateCondition__ are __mutually inclusive__.
expandApproval		☐		Set to true to include approval information.
expandAttachment		☐		Set to true if you w ant to see all attachments regarding this document.
expandLandedCosts		☐		Expland landed cost lines
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
expandNote		☐		Set to true to include description.
financialPeriod		☐		Filter by Financial Period, format YYYYPP
greaterThanValue		☐		Greater than value. The item w hich is the object for this, varies from API to API.
item		☐		Filter by Item used into the document lines
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
project		☐		Filter by the project w ith w hich the document is associated.
released		☐		Parameter for show ing if invoice has been released or not.
status		☐		The status of the document (Values: Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved)
supplier		☐		Filter by Supplier

Columns of Table Function

The columns of the table function SupplierInvoiceLineSubaccountSegments are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, which can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It shows the ID of the deferral schedule associated with the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description_2	varchar2	Description 2	☐	The Top part > Description > A user-provided description for this supplier ledger document.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
prebookSubaccount_active	char		☐	Active > The status of the identifier.

				original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values w indow > The Top part > The ID of the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values w indow > The table > The description of the segment value.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating w hether the item is a stock item or not.
subaccountId	int32		☐	SubID > The identifier of the subaccount.
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
termEndDate	datetime	Term End Date	☐	
termStartDate	datetime	Term Start Date	☐	
timeStamp_2	blob		☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overwriting each other (by using ETags and If-Match headers)
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.
transactionDescription	varchar2		☐	The table > Transaction descr. > Any description relevant to the transaction. An alphanumeric string of up to 30 characters may be used.
unitCost	double	Unit Cost	☐	The table > Unit cost > The unit cost of the item.
unitCostInCurrency	double		☐	Background calculation giving you the Unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
uom	varchar2	Unit of Measure	☐	The table > UoM > The unit of measure for the item.
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatCode_description	varchar2	VAT Code Description	☐	Click on the magnifier. > The description.
vatCode_id	varchar2	VAT Code ID	☐	Click on the magnifier. > The identifier.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineSubaccountSegmentsByApprovalDocumentId: Visma.net Financials Supplier Invoice Line Subaccount Segments by Approval Document ID

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Subaccount Segments by Approval Document ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineSubaccountSegmentsByApprovalDocumentId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
systemId		☑		SystemID referes to the approval document id created w hen the document is sent to approval

Columns of Table Function

The columns of the table function SupplierInvoiceLineSubaccountSegmentsByApprovalDocumentId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name_2	varchar2	Branch Number Name 2	☐	Click the magnifier. > The name.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number_2	varchar2	Branch Number 2	☐	Click the magnifier. > The identifier.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				calculates based in the specified credit terms.
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
cost	double	Cost	☐	The table > Cost > The unit cost of the item or service received from the supplier.
costInCurrency	double		☐	Background calculation giving you the Cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageAmt	double		☐	
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
deferralCode	varchar2		☐	The table > Deferral code > The deferral code assigned to the stock item or non-stock item specified in this document line.
deferralSchedule	int32		☐	The table > Original deferral schedule > A read-only column filled in by the system in the Debit adjustment documents created by the reversing process.It show s the ID of the deferral schedule associated

Name	Data Type	Label	Required	Documentation
				with the original document (such as a purchase invoice).
deferralScheduleNbr	varchar2		☐	The public CD/Code of the deferral schedule visible to user
description_2	varchar2	Description 2	☐	The Top part > Description > A user-provided description for this supplier ledger document.
description	varchar2	Description	☐	Description > The description of the identifier.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountAmount	double		☐	The table > Discount amount > The amount of the line-level discount that has been applied manually or automatically to this line.
discountAmountInCurrency	double		☐	Background calculation giving you the Discount amount in the selected currency.This field is applicable if the amount is given in a another currency than your default.
discountPercent	double	Discount Percent	☐	The table > Discount percent > The percent of the line-level discount that has been applied manually or automatically.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountUnitCost	double		☐	Background calculation giving you the Discount unit cost in the default currency.
discountUnitCostInCurrency	double		☐	Background calculation giving you the Discount unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The following types

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo_2	varchar2	Error Information 2	☐	
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
externalInventoryId	varchar2		☐	The table > External inventory id > External inventory number
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
inventoryNumber	varchar2	Inventory Number	☐	The table > Item ID > The unique ID of the particular item or service delivered by the supplier.
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	
lastModifiedDateTime	datetime	Last Modified	☐	System generated information.
lineNumber	int32	Line Number	☐	The table > Number at the left indicating the line number of the table.
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
manualDiscount	char	Manual Discount	☐	The table > Manual discount > A check box that indicates (if selected) that the discount has been applied manually.
metadata_maxPageSize_2	int64		☐	
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount_2	int64		☐	
metadata_totalCount	int64	Total Count	☐	
note_2	varchar2	Note 2	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
note	varchar2	Note	☐	The table > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
poLineNr	int32		☐	The table > Purchase order line > The line number of the purchase order line linked to this line of the invoice.
poNumber	varchar2	PO Number	☐	The table > Purchase order number > The number of the purchase order linked to this line of the invoice.
poReceiptLineNbr	int32		☐	The table > Purchase order receipt line > The line number of the purchase receipt's line that is linked to this line of the invoice.
poReceiptNbr	varchar2		☐	The table > Purchase order receipt no. > The number of the purchase receipt linked to this line of the invoice.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
prebookAccount_active	char		☐	
prebookAccount_description	varchar2		☐	Name of item/description
prebookAccount_externalCode1	varchar2		☐	Account class > The identifier of the account class.
prebookAccount_externalCode2	varchar2		☐	Account class > The name of the account class.
prebookAccount_number	varchar2		☐	Number of item
prebookAccount_type	varchar2		☐	Account > The account number.
prebookSubaccount_active	char		☐	Active > The status of the identifier.
prebookSubaccount_description	varchar2		☐	Description > The description of the identifier.
prebookSubaccount_errorInfo	varchar2		☐	
prebookSubaccount_lastModifiedDateTime	datetime		☐	System generated information.
prebookSubaccount_metadata_maxPageSize	int64		☐	
prebookSubaccount_metadata_totalCount	int64		☐	
prebookSubaccount_segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
prebookSubaccount_segmentId	int32		☐	The Segment values w indow > The Top part > The ID of the segment.
prebookSubaccount_segmentValue	varchar2		☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
prebookSubaccount_segmentValueDescription	varchar2		☐	The Segment values w indow > The table > The description of the segment value.
prebookSubaccount_subaccountId	int32		☐	SubID > The identifier of the subaccount.
prebookSubaccount_subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
prebookSubaccount_timeStamp	blob		☐	The timestamp of the subaccount, used for concurrency control.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
quantity	double	Quantity	☐	The table > Quantity > The quantity of the item or service to be delivered by the supplier.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice with retainage.
retainagePct	double	Retainage Percentage	☐	
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference between the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
segmentDescription	varchar2		☐	The Segment values window > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values window > The Top part > The ID of the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values window > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values window > The table > The description of the segment value.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that shows the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating whether the item is a stock item or not.
subaccountId	int32		☐	SubID > The identifier of the subaccount.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.

vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceLineSubaccountSegmentsByTypeDocumentTypeInvoiceNumber: Visma.net Financials Supplier Invoice Line Subaccount Segments by Type Document Type Invoice Number

Get a specific Invoice, DebitAdj, CreditAdj or PrepaymentData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Line Subaccount Segments by Type Document Type Invoice Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceLineSubaccountSegmentsByTypeDocumentTypeInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentType		☑		Identifies the Invoice
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceLineSubaccountSegmentsByTypeDocumentTypeInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
account_active	char	Account Active	☐	
account_description	varchar2	Account Description	☐	Name of item/description
account_externalCode1	varchar2	Account External Code 1	☐	Account class > The identifier of the account class.
account_externalCode2	varchar2	Account External Code 2	☐	Account class > The name of the account class.
account_number	varchar2	Account Number	☐	Number of item
account_type	varchar2	Account Type	☐	Account > The account number.
active	char	Active	☐	Active > The status of the identifier.
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled,

Name	Data Type	Label	Required	Documentation
				amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
segmentDescription	varchar2		☐	The Segment values w indow > The Top part > The description of the segment.
segmentId	int32	Segment ID	☐	The Segment values w indow > The Top part > The ID of the segment.
segmentValue	varchar2	Segment Value	☐	The Segment values w indow > The table > The value of the segment, alphanumeric.
segmentValueDescription	varchar2	Segment Value Description	☐	The Segment values w indow > The table > The description of the segment value.
splitHierarchy	varchar2		☐	The table > Split hierarchy > The number of the original row that has been split.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
stockItem	char	Stock Item	☐	Background information indicating w hether the item is a stock item or not.
subaccountId	int32		☐	SubID > The identifier of the subaccount.
subaccountNumber	varchar2		☐	Mandatory field: Subaccount* > The subaccount number. Format 9-XX.
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, w hich is specified in the AP303000 w indow .
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, w hich defines w hich amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
termEndDate	datetime	Term End Date	☐	
termStartDate	datetime	Term Start Date	☐	
timeStamp_2	blob		☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
timeStamp	blob	Timestamp	☐	The timestamp of the subaccount, used for concurrency control.
transactionDescription	varchar2		☐	The table > Transaction descr. > Any description relevant to the transaction. An alphanumeric string of up to 30 characters may be used.
unitCost	double	Unit Cost	☐	The table > Unit cost > The unit cost of the item.
unitCostInCurrency	double		☐	Background calculation giving you the Unit cost in the selected currency.This field is applicable if the amount is given in a another currency than your default.
uom	varchar2	Unit of Measure	☐	The table > UoM > The unit of measure for the item.
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoices. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
createdDateTime		☐		This value, generated by the system, indicates the creation date and time. Use it to retrieve all records that have been created since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __CreatedDateTime__ and __CreatedDateTimeCondition__ are __mutually inclusive__.

supplier		☐		Filter by Supplier

Columns of Table Function

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The columns of the table function SupplierInvoices are shown below. Each column has an SQL data type. A new non-null value must be provided for every required column at all times during insert.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.
branchNumber_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branchNumber_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
buyerReference	varchar2	Buyer Reference	☐	The Top part > Supplier ref. > The document's original reference number as assigned by the supplier (for informational purposes).
cashAccount	varchar2	Cash Account	☐	Financial details tab > The payment information section > Cash account > The cash account associated w ith the payment method.
cashDiscount	double	Cash Discount	☐	The Top part > Cash discount > The cash discount amount that has been or w ill be taken in the document, w hich the system calculates based in the specified credit terms.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
cashDiscountDate	datetime	Cash Discount Date	☐	The Top part > Cash discount date > The end date of the cash discount period, w hich the system calculates by using the supplier's credit terms.
cashDiscountInCurrency	double	Cash Discount in Currency	☐	Background calculation giving you the Cash discount in your default currency. This field is applicable if the amount is given in another currency than your default.
closedFinancialPeriod	varchar2	Closed Financial Period	☐	Format YYYYMM.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
createdDateTime	datetime	Created	☐	
creditTerms_description	varchar2	Credit Terms Description	☐	Click on the magnifier. > The description.
creditTerms_id	varchar2	Credit Terms ID	☐	Click on the magnifier. > The identifier.
currencyId	varchar2	Currency ID	☐	The Top part > Currency > The currency of the document.
curyRetainageTotal	double		☐	
curyRetainageUnreleasedAmt	double		☐	
date	datetime	Date	☐	The Top part > Date* > The date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
description	varchar2	Description	☐	The Top part > Description > A user-provided description for this supplier ledger document.
detailTotal	double	Detail Total	☐	The Top part > Detail total > The document total as specified in the Document details tab.
detailTotalInCurrency	double	Detail Total in Currency	☐	Background calculation giving you the Detail total in your default currency. This field is applicable if the amount is given in another currency than your default.
discountTotal	double	Discount Total	☐	The Top part > Discount total > The discount total calculated for the document. This total includes discounts of the Group and Document levels.
discountTotalInCurrency	double	Discount Total in Currency	☐	Background calculation giving you the Discount total in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
documentType	varchar2	Document Type	☐	The top part > Top part > Type > The type of the document. The follow ing types are available: Purchase invoice, credit adjustment, purchase credit note, prepayment.
documentVersionNumber	int64		☐	
dueDate	datetime	Due Date	☐	The Top part > Due date* > The date w hen payment for the document is due in accordance w ith the supplier's credit terms.
errorInfo	varchar2	Error Message	☐	
exchangeRate	double	Exchange Rate	☐	The Top part > Currency > The currency of the document.
financialPeriod	varchar2	Financial Period	☐	The financial period to w hich the transactions recorded in the document should be posted. Format YYYYMM.
hold	char	Hold	☐	The Top part > Hold > A check box that indicates that the status of the supplier ledger document is On hold.
lastModifiedDateTime	datetime	Last Modified	☐	
location_countryId	varchar2	Location Country ID	☐	Location*.
location_id	varchar2	Location ID	☐	Click the magnifier > The identifier
location_name	varchar2	Location Name	☐	Click the magnifier > The displayed name
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
note	varchar2	Note	☐	The table > Document details tab and Applications tab > Icon Notes > Pop-up w indow for providing any user-defined text connected w ith to invoice.
originalReferenceNumber	varchar2		☐	The original reference number of the document.
origInvoiceDate	datetime	Original Invoice Date	☐	The Top part > OrigInvoiceDate* > The original invoice date of the original supplier ledger document; by default, it is the current date, w hich can be changed.
payDate	datetime	Pay Date	☐	The Financial details tab > The Payment information section > Pay date* > The date w hen the invoice should be paid. The date is the difference betw een the document due date or discount date and the number of days specified in the Payment lead time field in AP303000.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
paymentMessage	varchar2		☐	The Financial details tab > The Payment information section > Payment message > The message connected w ith the payment.
paymentMethod_description	varchar2	Payment Method Description	☐	Click on the magnifier. > The description.
paymentMethod_id	varchar2	Payment Method ID	☐	Click on the magnifier. > The identifier.
paymentRefNo	varchar2	Payment Reference Number	☐	The Top part > Payment ref.no > The payment reference number of the document.
paySelected	char	Pay Selected	☐	The Financial details tab > The Payment information section > Approved for payment > When set to true indicates that the document is approved for payment.
postPeriod	varchar2	Post Period	☐	The Top part > Post period* > The post period of the payment document. Format MMYYYY.
referenceNumber	varchar2	Reference Number	☐	
retainageApply	char		☐	The Top part > Apply retainage > A check box that indicates (if selected) that this invoice is an invoice w ith retainage.
roundingDiff	double	Rounding Difference	☐	The Top part > Rounding diff. > The difference betw een the original invoice amount (including the VAT amount calculated by the system) and rounded invoice amount (including the VAT amount modified by a user for VAT-inclusive items).
roundingDiffInCurrency	double	Rounding Difference in Currency	☐	Background calculation giving you the Rounding diff. in your default currency. This field is applicable if the amount is given in another currency than your default.
status	varchar2	Status	☐	The Top part > Document status > A read-only field that show s the status of the supplier ledger document:[Hold, Balanced, Voided, Scheduled, Open, Closed, Printed, Prebooked, Reserved]
supplier_internalId	int64	Supplier Internal ID	☐	The internal id of the supplier
supplier_name	varchar2	Supplier Name	☐	Click the magnifier. > The name.
supplier_number	varchar2	Supplier Number	☐	Click the magnifier. > The identifier.
supplierReference	varchar2		☐	The Top part > Supplier ref. > The document's original

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
				reference number as assigned by the supplier (for informational purposes).
supplierTaxZone_defaultTaxCategory_description	varchar2		☐	Name of item/description
supplierTaxZone_defaultTaxCategory_number	varchar2		☐	Number of item
supplierTaxZone_defaultVatCategory	varchar2		☐	Click the magnifier. The Default VAT category for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_description	varchar2		☐	Click the magnifier. The description for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_errorInfo	varchar2		☐	
supplierTaxZone_id	varchar2		☐	Click the magnifier. The identifier for the VAT zone of the supplier, which is specified in the AP303000 window.
supplierTaxZone_metadata_maxPageSize	int64		☐	
supplierTaxZone_metadata_totalCount	int64		☐	
taxCalculationMode	varchar2		☐	The Financial details tab > The VAT section > VAT calculation mode > The VAT calculation mode, which defines which amounts (VAT-inclusive or VAT-exclusive) should be entered in the detail lines of a document (TaxSetting, Gross, Net)
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overwriting each other (by using ETags and If-Match headers)
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoicesByApprovalDocumentId: Visma.net Financials Supplier Invoices by Approval Document ID

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoices by Approval Document ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoicesByApprovalDocumentId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
systemId		☑		SystemID referes to the approval document id created when the document is sent to approval

Columns of Table Function

The columns of the table function SupplierInvoicesByApprovalDocumentId are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) shown in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected with the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.

				other (by using ETags and If-Match headers)
vatAmount	double	VAT Amount	☐	The Top part > VAT amount > The VAT amount to be paid for the document. Enter this amount manually according to the VAT amount specified in the original document.
vatExemptTotal	double	VAT Exempt Total	☐	The Top part > VAT exempt total > The document total that is exempt from VAT.
vatExemptTotalInCurrency	double	VAT Exempt Total in Currency	☐	Background calculation giving you the VAT exempt total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTaxableTotal	double	VAT Taxable Total	☐	The Top part > VAT taxable total > The document total that is subjected to VAT.
vatTaxableTotalInCurrency	double	VAT Taxable Total in Currency	☐	Background calculation giving you the VAT taxable total in your default currency. This field is applicable if the amount is given in another currency than your default.
vatTotal	double	VAT Total	☐	The Top part > VAT total > The total amount of tax paid in the document.
vatTotalInCurrency	double	VAT Total in Currency	☐	Background calculation giving you the VAT total in your default currency. This field is applicable if the amount is given in another currency than your default.
withholdingTax	double		☐	The Top part > With. tax > The amount of withholding tax calculated for the document, if applicable.
withholdingTaxInCurrency	double		☐	Background calculation giving you the With. tax in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoicesByTypeDocumentTypeInvoiceNumber: Visma.net Financials Supplier Invoices by Type Document Type Invoice Number

Get a specific Invoice, DebitAdj, CreditAdj or PrepaymentData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoices by Type Document Type Invoice Number

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoicesByTypeDocumentTypeInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentType		☑		Identifies the Invoice
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoicesByTypeDocumentTypeInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the document in Visma.net Approval. [New , Canceled, SentToApproval, ReceivedByApproval, InProgressApproval, RejectedInApproval, ApprovedInApproval, ActiveWorkflow Approval.
balance	double	Balance	☐	The Top part > Balance > The balance of the supplier ledger document after VAT (if inclusive) and the discount as specified in the tabs below .
balanceInCurrency	double	Balance in Currency	☐	Background calculation giving you the Balance in your default currency. This field is applicable if the amount is given in another currency than your default.

SupplierInvoiceTaxDetailLinesByApprovalDocumentId: Visma.net Financials Supplier Invoice Tax Detail Lines by Approval Document ID

Get an invoice based on the systemId. SystemID is used for approving supplier invoicesData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Tax Detail Lines by Approval Document ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceTaxDetailLinesByApprovalDocumentId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

SupplierInvoiceTaxDetailsByTypeByDocumentTypeInvoiceNumber: Visma.net Financials Supplier Invoice Tax Details by Type Document Type Invoice Number

Get a specific Invoice, DebitAdj, CreditAdj or PrepaymentData for a single invoice. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierInvoice

Label: Supplier Invoice Tax Details by Type Document Type Invoice Number

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierInvoiceTaxDetailsByTypeByDocumentTypeInvoiceNumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
documentType		☑		Identifies the Invoice
expandLandedCosts		☐		Expland landed costs information.
expandLinePrebookAccounts		☐		Expland line-level pre-booking account and sub-account information.
invoiceNumber		☑		Identifies the Invoice

Columns of Table Function

The columns of the table function SupplierInvoiceTaxDetailsByTypeByDocumentTypeInvoiceNumber are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
amount	double	Amount	☐	The Top part > Amount > The amount to be paid for the document. Equal to the amount (or to the sum of amounts) show n in the Amount column of the Document details tab.
approvalDetails_attachmentID	varchar2	Approval Details Attachment ID	☐	The Approval details tab > Default document > The default document that includes the payments requiring approval.
approvalDetails_comment	varchar2	Approval Details Comment	☐	The Approval details tab > Comment > The comment connected w ith the approval of the payments.
approvalStatus	varchar2	Approval Status	☐	The Top part > Approval status > The status of the

SupplierLocationPaymentMethodDetailsByBAccountId

Get a range of Locations for a BAccountRequest page size must be lower or equal to the allowed max page size which is returned as part of the metadata information.If requested page size is greater than allowed max page size, request will be limited to max page sizeData for the Locations

Catalog: VismaNet

Schema: SupplierLocation

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierLocationPaymentMethodDetailsByBAccountId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

3.1.98 Schema: SupplierPayment
3.1.98.1 Tables
SupplierPaymentByVarious

Get a specific SupplierPayment by type and numberData for a single supplier payment. The response headers include an ETag after a successful GET operation.

Catalog: VismaNet

Schema: SupplierPayment

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierPaymentByVarious. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function SupplierPayments. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
balance		☐		This value represents balance of the payment remaining to be applied and released. Only released applications w ill count tow ards the balance._Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
balanceCondition		☐		This value represents the condition to be applied to the Balance w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __Balance__ and __BalanceCondition__ are __mutually inclusive__.
branch		☐		Filter by Branch
docDate		☐		This value indicates the document date. Use it to retrieve all records that have the Document Date since that time, up to the future.Accepted

EmployeeTimeCardSummaries: Visma.net Financials Employee Time Card Summaries

Get all employee time cards, a filter needs to be specified - ScreenId=EP305000

Catalog: VismaNet

Schema: TimeCard

Label: Employee Time Card Summaries

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function EmployeeTimeCardSummaries. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
employeeCd		☐		
greaterThanValue		☐		Greater-than value. The item which is the object for this, varies from API to API.
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record was modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied when retrieving records.Accepted values (without the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeCondition__ are __mutually inclusive__.
orderBy		☐		This field has been deprecated and will be removed in future versions. The OrderBy parameter has no effect on the result.
status		☐		The status of the document. (Values: Hold, Open, Approved, Rejected, Released)
type		☐		Identifies the type of the time card (Normal, Corrected, NormalCorrected) (Values: Normal, Correction, NormalCorrected)
week		☐		Identifies the week number of the time card

Columns of Table Function

The columns of the table function EmployeeTimeCardSummaries are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
approvalStatus_2	varchar2		☐	The top part > Approval status > The approval status of the time card
approvalStatus	varchar2	Approval Status	☐	Approval status > The approval status, w hich indicates w hether the summary row requires approval and, if it does, w hat the current state of approval is.
approvalStatusText_2	varchar2		☐	
approvalStatusText	varchar2	Approval Status Text	☐	last approval comment > The approval status text suitable for display
approver	varchar2	Approver	☐	The identifier of the person authorized to approve the activity, if approval is required. This is either the approver of the project task or, if no approver is assigned to the project task, the project manager.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
description	varchar2	Description	☐	Description > The description of the reported w ork hours.
earningType_code	varchar2		☐	Mandatory field: Code* > The unique ID of the type of hour.
earningType_description	varchar2		☐	Mandatory field: Description > The brief description of the type of hour.
earningType_isActive	char		☐	Active > A check box that indicates (if selected) that the type of hour is active and can be used.
earningType_isBillable	char		☐	Invoicable > A check box that indicates (if selected) that the type is treated as invoiceable by default.
earningType_isOvertime	char		☐	Overtime > A check box that indicates (if selected) that the type of hour is treated as overtime.
earningType_lastModifiedDateTime	datetime		☐	System generated information.
earningType_overtimeMultiplier	double		☐	Multiplier > The value by w hich the employee cost for this type of hour is multiplied w hen the time activity is released.
employee_internalId	varchar2		☐	
employee_name	varchar2		☐	The name of the particular destination of the selected type.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
employee_number	varchar2		☐	The identifier of the particular destination of the selected type.
errorInfo	varchar2	Error Message	☐	
fri	int32		☐	Fri > The w ork time reported for Friday, including overtime.
invoiceable_2	int32		☐	The top part > Regular column: Invoicable > The invoiceable w ork hours spent by the employee during the w eek
invoiceable	char	Invoiceable	☐	Invoicable > A check box that you select to indicate that these w ork hours are invoiceable.
invoiceableOvertime	int32	Invoiceable Overtime	☐	The top part > Overtime column: Invoicable > The invoiceable overtime spent by the employee during the w eek
invoiceableTotalTime	int32	Invoiceable Total Time	☐	The top part > Total column: Invoicable > The total invoiceable w orking time (regular and overtime) for the w eek
lastModifiedDateTime_2	datetime	Last Modified Date/Time 2	☐	System generated information: The last time the time card line w as modified
lastModifiedDateTime	datetime	Last Modified	☐	The last time the time card line w as modified
lineId	guid		☐	The time card line id
lineNumber	int32	Line Number	☐	The time card line number
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
mon	int32		☐	Mon > The w ork time reported for Monday, including overtime.
origRefNbr	varchar2		☐	The top part > Orig. ref. no. > The reference number of the time card being corrected. This box is filled in only w hen Correction is specified in the Type box
overtimeSpent	int32	Overtime Spent	☐	The top part > Overtime column: Time spent > The w ork hours spent by the employee during the w eek on activities w ith the Overtime earning type.
project_description	varchar2	Project Description	☐	Click on the magnifier. > The description.
project_id	varchar2	Project ID	☐	Click on the magnifier. > The identifier.
project_internalId	int32		☐	The internal identifier.
projectTask_description	varchar2	Project Task Description	☐	Click on the magnifier. > The description.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
projectTask_id	varchar2	Project Task ID	☐	Click on the magnifier. > The identifier.
projectTask_internalId	int32		☐	The internal identifier.
refNbr	varchar2	Reference Number	☐	The top part > Ref. no. > The unique reference number of the time card, which Acumatica ERP automatically assigns according to the numbering sequence specified as the Time Card Numbering Sequence on the Time and Expenses Preferences (EP.10.10.00) form.
sat	int32		☐	Sat > The work time reported for Saturday, including overtime.
status	varchar2	Status	☐	The top part > Status > The status of the time card
sun	int32	Sunday	☐	Sun > The work time reported for Sunday, including overtime.
thu	int32		☐	Thu > The work time reported for Thursday, including overtime.
timeSpent_2	int32		☐	The top part > Regular column: Time spent > The work hours spent by the employee during the week on activities with the Regular Hours earning type.
timeSpent	int32	Time Spent	☐	Time spent > The work time (regular and overtime) that the employee spent on the project and task during the week.
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overwriting each other (by using ETags and If-Match headers)
totalTimeSpent	int32	Total Time Spent	☐	The top part > Total column: Time spent > The total working time (regular and overtime) for the week
tue	int32	Tuesday	☐	Tue > The work time reported for Tuesday, including overtime.
type	varchar2	Type	☐	The top part > Type > The type of the time card. The following options are available:• Normal: Regular time card• Correction: Corrective time card, which is a time card that updates a released time card
wed	int32	Wednesday	☐	Wed > The work time reported for Wednesday, including overtime.
week_description	varchar2	Week Description	☐	Name of item/description
week_number	varchar2	Week Number	☐	Number of item

Catalog: VismaNet

Schema: UiExtension

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function UiExtensionsByOwnerId. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
ownerId		☑		
screenId		☐		
type		☐		Values: Action, Menu.

VATCategoryLinesById: Visma.net Financials VAT Category Lines by ID

Get a specific Vat - TX205000

Catalog: VismaNet

Schema: Vat

Label: VAT Category Lines by ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function VATCategoryLinesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
vatId		☑		Mandatory. Value for VatID to be looked for.

VATs: Visma.net Financials VATs

Get a range of Vats - ScreenId=TX205000

Catalog: VismaNet

Schema: Vat

Label: VATs

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function VATs. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
lastModifiedDateTime		☐		This value, generated by the system, indicates the last time the record w as modified. Use it to retrieve all records that have been modified since that time, up to the present.Accepted format:* ```yyyy-MM-dd```* ```yyyy-MM-dd HH:mm:ss```* ```yyyy-MM-dd HH:mm:ss.FFF```* ```yyyy-MM-ddTHH:mm:ss```* ```yyyy-MM-ddTHH:mm:ss.FFF```_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.
lastModifiedDateTimeCondition		☐		This value represents the condition to be applied w hen retrieving records.Accepted values (w ithout the single quotes):* '>' for greater than* '<' for less than* '>=' for greater than or equal* '<=' for less than or equal_Note:_ __LastModifiedDateTime__ and __LastModifiedDateTimeConditio n__ are __mutually inclusive__.

VATZonesById: Visma.net Financials VAT Zones by ID

Get a specific Vat - TX205000

Catalog: VismaNet

Schema: Vat

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Label: VAT Zones by ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function VATZonesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
vatId		☑		Mandatory. Value for VatID to be looked for.

vatCategoryId	varchar2	VAT Category ID	☐	Mandatory field: The top part > VAT category ID* > The unique ID of the VAT category. An alphanumeric string of up to six characters can be used.
vatId	varchar2	VAT ID	☐	Mandatory field: VAT ID* > The ID of the VAT included in the category.
vatRate	double	VAT Rate	☐	The VAT rate of the line.
vendorCd	varchar2		☐	Vendor code > The vendor number associated w ith the VAT category line.

VatCategoryLineVatRatesById: Visma.net Financials VAT Category Line VAT Rates by ID

Get a specific VatCategory

Catalog: VismaNet

Schema: VatCategory

Label: VAT Category Line VAT Rates by ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function VatCategoryLineVatRatesById. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
taxCategoryId		☑		Identifies the VatCategory
vendorCd		☐		Optional vendor number (tax agency) parameter

				another posting ledger can be selected.
ledgerDescription	varchar2	Ledger Description	☐	Mandatory field: The top part > Ledger* > Click the magnifier > The description of the ledger to w hich batch transactions are posted. By default, it is the default posting ledger specified for the branch in the GL101010 w indow , but another posting ledger can be selected.
metadata_maxPageSize	int64	Metadata Max Pagesize	☐	
metadata_totalCount	int64	Total Count	☐	
module	varchar2	Module	☐	The top part > Workspace > The w orkspace w here the batch originates. New batches can be created only for General ledger.
originalBatchNumber	varchar2		☐	The top part > Orig. batch number > For a scheduled or auto-reversing batch, the reference number of the batch used as a template.
postPeriod	varchar2	Post Period	☐	Mandatory field: The top part > Post period* > The financial period to w hich the transactions recorded in the document should be posted. Format MMYYYY.
reversingEntry	char		☐	The top part > Reversing entry > A check box that indicates (if selected) that the batch is a reversing batch. The Orig.batch number field displays the ID of the batch that w as reversed by this batch.
skipVatAmountValidation	char		☐	The top part > Skip VAT amount validation > A check box that (if selected) causes automatic validation of a VAT-related transaction that you create manually to be skipped.
status	varchar2	Status	☐	The top part > Status > The current status of the batch. The status defines w hat processing can be applied to the batch. The follow ing options are available: On hold, Balanced, Scheduled, Unposted, Posted, Void.
timeStamp	blob	Timestamp	☐	Identifier that represents a specific version of the resource.It helps to prevent simultaneous updates of the resource from overw riting each other (by using ETags and If-Match headers)
transactionCode	varchar2		☐	

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
transactionCodeDescription	varchar2		☐	The Table part > Transaction description > A description of the transaction or any comments relevant to the transaction.
transactionDate	datetime		☐	Mandatory field: The top part > Transaction date* > The date w hen the batch w as created, w hich relates to the transaction dates of the journal entries.

3.1.107 Schema: Warehouse

3.1.107.1 Tables

WarehouseBywarehouseID: Visma.net Financials Warehouse by Warehouse ID

Get a specific Warehouse

Catalog: VismaNet

Schema: Warehouse

Label: Warehouse by Warehouse ID

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function WarehouseBywarehouseID. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

WarehouseLocationPrimaryItemClassAttributes: Visma.net Financials Warehouse Location Primary Item Class Attributes

Get a range of Warehouses - ScreenId=IN204000

Catalog: VismaNet

Schema: Warehouse

Label: Warehouse Location Primary Item Class Attributes

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function WarehouseLocationPrimaryItemClassAttributes. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
active		☐		Selects only the w arehouses that are active/inactive.
branch		☐		Selects only the w arehouses for the specified branch.

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
warehouseID		☑		Identifies the Warehouse

Columns of Table Function

The columns of the table function WarehouseLocationsByWarehouseID are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
active_2	char		☐	The top part > Active > This check box indicates (if selected) that the warehouse is active.
active	char	Active	☐	Active > This check box indicates whether this location is active.
address_addressId	int32	Address ID	☐	Information retrieved from the system.
address_addressLine1	varchar2	Address Line 1	☐	Address ! > The first line in the address of the warehouse.
address_addressLine2	varchar2	Address Line 2	☐	Address 2 > The second line in the warehouse address.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Label	Required	Documentation
address_addressType	varchar2	Address Type	☐	Information retrieved from the system.
address_city	varchar2	City	☐	City > The city of the warehouse address.
address_country_errorInfo	varchar2		☐	
address_country_id	varchar2	Country ID	☐	Mandatory field: Country ID* > The unique two-letter country ID according to international standard ISO 3166.
address_country_metadata_maxPageSize	int64		☐	
address_country_metadata_totalCount	int64		☐	
address_country_name	varchar2	Country Name	☐	Mandatory field: Country name* > The complete name of the country.
address_county_id	varchar2	County ID	☐	Click the magnifier > The identifier
address_county_name	varchar2	County Name	☐	Click the magnifier > The displayed name
address_postalCode	varchar2	Postal Code	☐	Postcode > The postcode relevant for the warehouse address.
address_validated	char	Address Validated	☐	Information retrieved from the system.
assemblyValid	char		☐	Assembly allowed > You select this check box if assembly operations are allowed at this location.
avgDefaultCost	varchar2		☐	The top part > Avg. default return cost > For items with the Average valuation method, the option that defines which of costs should be used for returns and receipts.
branch_name	varchar2	Branch Name	☐	Click the magnifier. > The name.
branch_number	varchar2	Branch Number	☐	Click the magnifier. > The identifier.
COMPANY_CODE	varchar2(30)	Company Code	☑	Partition code, segmenting the data.
COMPANY_NAME	varchar2(240)	Company Name	☑	Name of the partition.
contact_attention	varchar2		☐	Attention > The department or person to be noted on the attention line, if this line is used by your company.
contact_companyName	varchar2		☐	Company name > The legal business name of the warehouse to appear on the documents.
contact_contactId	int32	Contact ID	☐	Information retrieved from the system.

Name	Data Type	Label	Required	Documentation
returnLocation_id	varchar2	Return Location ID	☐	Click on the magnifier. > The identifier.
salesValid	char		☐	Sales allow ed > You select this check box if sales are allow ed from this location.
shipLocation_description	varchar2	Ship Location Description	☐	Click on the magnifier. > The description.
shipLocation_id	varchar2	Ship Location ID	☐	Click on the magnifier. > The identifier.
timestamp	varchar2	Timestamp	☐	Timestamp of the w arehouse record
transfersValid	char		☐	Transfers allow ed > You select this check box if transfers are allow ed for this location.
w arehouseID	varchar2	Warehouse ID	☐	Mandatory field: The top part > Warehouse ID* > The unique ID of the w arehouse.

Warehouses: Visma.net Financials Warehouses

Get a range of Warehouses - ScreenId=IN204000

Catalog: VismaNet

Schema: Warehouse

Label: Warehouses

This is a read-only table function. The Visma.net Financials API may not support changing the data or the Invantive UniversalSQL driver for Visma.net Financials does not cover it. In the latter case, please use the table NativePlatformScalarRequests to upload data to the Visma.net Financials API.

Parameters of Table Function

The following parameters can be used to control the behaviour of the table function Warehouses. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `select * from table(value1, value2, value3)` on a table with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `select * from table(name1 => value1, name3 => value3)` on the same table will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
active		☐		Selects only the w arehouses that are active/inactive.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Name	Data Type	Required	Default Value	Documentation
branch		☐		Selects only the warehouses for the specified branch.

Columns of Table Function

The columns of the table function Warehouses are shown below. Each column has an SQL data type.

Name	Data Type	Label	Required	Documentation
active	char	Active	☐	The top part > Active > This check box indicates (if selected) that the warehouse is active.
address_addressId	int32	Address ID	☐	Information retrieved from the system.
address_addressLine1	varchar2	Address Line 1	☐	Address ! > The first line in the address of the warehouse.

4 Package: dcr_metadata

4.1 Procedures

4.1.1 dcr_metadata.get_partitions: Visma.net Financials Data container metadata package

Get all partitions.

Documentation:

List all partitions.

5 Package: vnt_attachment

5.1 Procedures

5.1.1 vnt_attachment.attachment_putbyattachmentid: Visma.net Financials Package for Attachment operations that could not be mapped to a table.

The the Response Message has StatusCode NoContent if Put operation succeed

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_attachment.attachment_putbyattachmentid. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_attachmentId	guid	☑		Identifies the Attachment to update
p_sendToAutoinvoice	string	☐		The field SendToAutoinvoice only applies to files attached to Customer documents

6 Package: vnt_branch

6.1 Procedures

6.1.1 vnt_branch.branch_putbanksettingsforbranchbybranchnumber: Visma.net Financials Package for Branch operations that could not be mapped to a table.

Response Message has StatusCode No Content if PUT operation succeed

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_branch.branch_putbanksettingsforbranchbybranchnumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_cashtransaction.cashtransaction_reversebyreferencenbr. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_referenceNbr	string	☑		Reference number of the cash transaction to be reversed.
p_If-Match	string	☐		The If-Match HTTP header allow s clients to update a resource only if its current version matches a specific ETag. This mechanism helps prevent conflicts w hen multiple clients attempt to modify the same resource

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_contractId	string	☑		Reference number of the customer contract to be set up
p_setupDate	datetime	☐		Optional Setup Date
p_If-Match	string	☐		The If-Match HTTP header allows clients to update a resource only if its current version matches a specific ETag. This mechanism helps prevent conflicts when multiple clients attempt to modify the same resource simultaneously.The If-Match header should be included in the request headers using the following syntax: If-Match: "etag_value"* If the POST operation is successful, the server responds with 200 OK and includes the new ETag value in the response headers.* If the ETag on the server does not match the value provided in the If-Match header, the server responds with 412 Precondition Failed.

14.1.5 vnt_customercontract.customercontract_terminatecontractbycontractid: Visma.net Financials Package for CustomerContract operations that could not be mapped to a table.

Response Message has StatusCode BadRequest or InternalServerError if POST operation failed
</br>In this endpoint, If-Match can be checked against resource current version when calling with 'erp-api-background' HTTP header.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_customercontract.customercontract_terminatecontractbycontractid. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_contractId	string	☑		Reference number of the customer contract to be terminated
p_terminationDate	datetime	☐		Optional Termination Date
p_If-Match	string	☐		The If-Match HTTP header allows clients to update a resource only if its current version matches a specific ETag. This mechanism helps prevent conflicts when multiple clients attempt to modify the same resource simultaneously.The If-Match header should be included in the request headers using the following syntax: If-Match: "etag_value"* If the POST operation is successful, the server responds with 200 OK and includes the new ETag value in the response headers.* If the ETag on the server does not match the value provided in the If-Match header, the server responds with 412 Precondition Failed.

The following parameters can be used to control the behaviour of the procedure vnt_customerdebitnote.customerdebitnote_sendtoautoinvoicebydebitnotenumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_debitNoteNumber	string	☑		Reference number of the debit note to be send to AutoInvoice
p_If-Match	string	☐		The If-Match HTTP header allows clients to update a resource only if its current version matches a specific ETag. This mechanism helps prevent conflicts when multiple clients attempt to modify the same resource simultaneously.The If-Match header should be included in the request headers using the following syntax: If-Match: "etag_value"* If the POST operation is successful, the server responds with 200 OK and includes the new ETag value in the response headers.* If the ETag on the server does not match the value provided in the If-Match header, the server responds with 412 Precondition Failed.

17.1.5 vnt_customerdebitnote.customerdebitnote_updatebydebitnotenumber: Visma.net Financials Package for CustomerDebitNote operations that could not be mapped to a table.

Response Message has StatusCode NoContent if PUT operation succeed
</br>Response Message has StatusCode BadRequest if PUT operation failed
</br>In this endpoint, If-Match can be checked against resource current version when calling with 'erp-api-background' HTTP header.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_customerdebitnote.customerdebitnote_updatebydebitnotenumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

20 Package: vnt_customerinvoicev2

20.1 Procedures

20.1.1 vnt_customerinvoicev2.customerinvoicev2_create: Visma.net Financials Package for CustomerInvoiceV2 operations that could not be mapped to a table.

Response Message has StatusCode Created if POST operation succeed
</br>Response Message has StatusCode BadRequest or InternalServerError if POST operation failed
</br>The response headers include an ETag after a successful POST operation.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_customerinvoicev2.customerinvoicev2_create. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

25.1.3 vnt_discount.discount_updatediscountsbydiscountcodeseries: Visma.net Financials Package for Discount operations that could not be mapped to a table.

In this endpoint, If-Match can be checked against resource current version when calling with 'erp-api-background' HTTP header.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_discount.discount_updatediscountsbydiscountcodeseries. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

29.1.4 vnt_inventory.inventory_putbyinventoryid: Visma.net Financials Package for Inventory operations that could not be mapped to a table.

Response Message has StatusCode NoContent if PUT operation succeed

Parameters of Procedure

(C) Copyright 2004-2025 Invantive Software B.V., the Netherlands. All rights reserved.

The following parameters can be used to control the behaviour of the procedure vnt_inventory.inventory_putbyinventoryid. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_inventoryID	int32	☑		Identifies the inventory item to update
p_inventoryNumber	string	☐		Mandatory for POST, not applicable for PUT. The unique alphanumeric identifier of the item that is used in UI.
p_status	string	☐

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

43 Package: vnt_purchaseorder

43.1 Procedures

43.1.1 vnt_purchaseorder.purchaseorder_createpurchasereceiptfrompurchaseorderbypurchaseordernbr: Visma.net Financials Package for PurchaseOrder operations that could not be mapped to a table.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_purchaseorder.purchaseorder_createpurchasereceiptfrompurchaseorderbypurchaseordernbr. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Parameters of Procedure

The following parameters can be used to control the behaviour of the procedure vnt_salesorder.salesorder_createlineattachmentbyordernumberlinenumber. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

The following parameters can be used to control the behaviour of the procedure vnt_timecard.timecard_puttimecardonholdbytimecardcd. A value must be provided at all times for required parameters, but optional parameters in general do not need to have a value and the execution will default to a pre-defined behaviour. Values can be specified by position and by name. In both cases, all parameters not specified will be evaluated using their default values.

Value specification by position is done by listing all values from the first to the last needed value. For example: a `begin package.procedure(value1, value2, value3); end` on a procedure with four parameters will use the default value for the fourth parameter and the specified values for the first three.

Value specification by name is done by listing all values that require a value. For example with `begin package.procedure(name1 => value1, name3 => value3); end` on the same procedure will use the default values for the second and fourth parameters and the specified values for the first and third.

Name	Data Type	Required	Default Value	Documentation
p_timeCardCd	string	☑		Reference number of the time card to be put on hold
p_If-Match	string	☐		The If-Match HTTP header allows clients to update a resource only if its current version matches a specific ETag. This mechanism helps prevent conflicts when multiple clients attempt to modify the same resource simultaneously.The If-Match header should be included in the request headers using the following syntax: If-Match: "etag_value"* If the POST operation is successful, the server responds with 200 OK and includes the new ETag value in the response headers.* If the ETag on the server does not match the value provided in the If-Match header, the server
